This image shows a very faint, handwritten document on lined paper. The text is mostly illegible due to fading and the presence of large, dark, diagonal ink marks. However, some words and numbers can be identified:

- A large number "13 1/2" is located in the top right corner.
- The text "H. H. Dix Co." appears twice.
- "Dogwood" is written near the bottom left.
- The number "62" is on the left side.
- The number "40" is on the right side.

The document is heavily marked with dark ink, particularly a large diagonal line from the middle left to the middle right, which obscures much of the text. There are also several smaller horizontal and vertical marks.

May 11th we talked to Col P about this matter

C.S.O.:Resume of Agriculture Subcommission's 1945 Italian Wheat Crop Estimate.

This report is based upon data supplied by the Ministry of Agriculture field organization acting in AMG territory under supervision of AMG Regional Agricultural Officers and supplemented by observations made by Allied survey parties in Central and South Italy and Sicily during the first ten days of June 1945.

IMPORTANT POINTS:

Crop estimated at 4,427,000 metric tons as compared with 6,390,661 metric tons last season and a ten-year average of 7,103,000 metric tons.
April 1, 2000 less than year.

Acreage planted to wheat estimated at 10,783,799 as compared with 11,769,770 last year and a ten-year average of 12,572,300 acres.

It was observed that the grain threshed was smaller in size than under normal crop conditions. Over half of crop was yet to be cut at time of this survey and in mountainous regions the wheat was still immature.

In general, the crop was said to be approximately fifteen days late in maturing this year, with the following factors contributing to this lateness:

- a. Lack of spring rains which retarded growth
- b. Late seeding of the crop in some areas
- c. Lack of phosphate fertilizer which ordinarily hastens maturity.

Drought: Lack of moisture is estimated to be responsible for at least 30% of the 1945 wheat crop production. Small marginal farms suffered most. In Foggia area large farms were badly damaged.

Fertilizer Deficiency: Shortage of fertilizers estimated to cause 15% of crop production. Shortage of phosphate fertilizer and lack of nitrates.

Other Adverse Factors:

- a. Late seeding.
- b. Frosts
- c. Flooding and hot winds.

There are some other factors causing reduction in crop.

10026.24/1.1.16

to

The President of the Council of Ministers

Rome, 22 January 1946

Dear Admiral,

In relation with your proposal for the resumption of the publication of Italian agricultural statistics, as from your letter of November 30th, n. 49526/10026.24/1.1.16, President Parri expressed his point of view on the advisability of revoking all the regulations which previously suspended the publication of statistical data of an economic or financial character.

After I assumed the direction of the Government, I gave my personal attention to such a matter, and in agreement with the above mentioned opinion, in a decree dated 21 December 1945, I revoked all the regulations suspending or limiting the publication of acts and documents regarding the economic and financial life of the State.

I now inform you that the above mentioned decree has been published in the Gazzetta Ufficiale del Regno, n. 1, of January instant, and that it became in force at that date.

Believe me,

Sincerely yours,

E. De Gasperi

91-1/FOOD

20 December 1945

SUBJECT: Grain Supplies

DEC 28 1945

TO : HQ. AMG., Naples Commune.
Attn. Commissioner.

61

1. Reference your letter C/1730 of 10 December, 1945, and conversation (Col. Pennycuick/Maj. Hayden) of 17 December, 1945.

2. It is understood that a brief outline of the present critical situation with regard to grain supplies for Italy as a whole was given during the above-mentioned conversation. Future prospects of grain arrivals during the remainder of December and throughout January were also mentioned. It should, however, now be added that most recent information received from Washington indicates that, owing to various uncontrollable factors, most of the December loading programme has been concentrated in the last part of December and the beginning of January; and consequently there will be no real improvement in the overall supply position for Italy until the beginning of February.

3. This Office letter 50-2/Food of 26 November 1945 is merely an indication as to the tonnages which would be put through Italian ports in January in the event of the total programmed amount actually arriving in that month.

4. This Sub-Commission agrees that such a reserve as you suggest should be built up. Yet, the fact must be faced that, in spite of every effort made by this Headquarters, it has been found impossible to maintain loadings ex U.S. sources at the rate shown in the FEA Interim Supply Programme for the last quarter of this year. Accordingly, the whole of Italy has at the moment to be maintained on, at the best, a week-to-week basis, and, at the worst, on a day-to-day basis.

5. For your information, the following ships have recently been diverted for discharge at Naples:

		<u>Estimated arrival</u>	<u>Tons</u>
seBROWN	Castellammare/Salerno	21 Dec., 1945	6906

SUBJECT: Wheat Amassing in Liguria Region

DEC

TO : Executive Commissioner

75

1. Reference is made to the attached letter (LIG/HQ/161), and the report, both in connection with the grain collection campaign in Liguria Region.

2. The situation appears to be clearly summarized in paragraph 4 of the Regional Commissioner's letter. The prevalence of very small farms reduces the collections in bad years. The Ministry of Agriculture on 17 November, in agreement with UNSEA, estimated the wheat production for Liguria at 177,310 quintals. This figure was arrived at after a series of discussions with the Inspectors of Agriculture and the URSEA officials of Liguria, and it is believed that it should stand firm.

3. The estimated amassable as of 15 September, which totaled 4,300 quintals, was reduced to 2,600 quintals on 29 November by the Ministry of Agriculture. This latter figure is very near the figure, i.e., 2,350 quintals, indicated by the URSEA officials. To date 1,881 quintals of wheat have been amassed in Liguria.

4. The situation indicated in paragraph 3 of Colonel Selby's letter appears to exist no longer, for the production and amassable figures were arrived at in agreement with the Provincial Inspectors of Agriculture and the URSEA Offices of Liguria.

SUBJECT : Wheat Amassing in LIGURIA Region
TO : Headquarters, Allied Commission (Att Executive Commissioner)
NOV 20 1945

1. Reference your ES/10.03 dated 5 Nov 45 which was received here on 13 Nov 45.

2. I forward herewith a report on amassing of 1945 wheat in LIGURIA Region. I have had no Agriculture Officer here since September but every effort has and is being made to amass as much wheat as possible. My Commerce Officer has visited all the Provinces and been into the matter very fully.

3. In addition to his remarks it would appear that there has been a complete lack of co-operation between the Government Official, Il Capo del Ispettorato Provinciale dell' Agricoltura who is the Official who makes the estimate of amassable wheat to the Ministry of Agriculture, and the local Provincial Official, the Commissario dell' Ufficio Provinciale Statistica Agricoltura, with the result that in all cases the estimate of amassable wheat has been too optimistic. I have instructed the Prefects to take more interest in this matter.

4. I do not think that in this mountainous country forcible methods of amassing on the part of the Carabinieri etc will have much effect and it is a fact that owing to the presence of mines, particularly in SAVONA Province, drought and the unsettled state of the Region during the season when wheat was being planted, has all resulted in less production than was estimated.

HEADQUARTERS
ALLIED MILITARY GOVERNMENT
LIGURIA REGION
Agriculture Division

Ref. LIG/AGR/7023

16 November 1945

REPORT ON AMASSING OF 1945 WHEAT
IN LIGURIA REGION

1... The Director of Agriculture Sub-Commission informed this Headquarters on 25th September that on 15th September the Ministry of Agriculture, Rome had prepared the following estimates for 1945:-

	<u>Production</u> (Estimates as of 15 Sept.)	<u>Amassable</u> (Estimates as of 15 Sept.)
	<u>QUINTALS</u>	<u>QUINTALS</u>
Genoa Province	65.000	300
Imperia "	10.000	-
La Spezia "	40.000	4.000
Savona "	48.000	-
	<u>163.000</u>	<u>4.300</u>

2... On enquiry at the Local Provincial Agricultural Offices (UPSEA), the following estimates have been received:-

	<u>Production</u>	<u>Amassable</u>
	<u>QUINTALS</u>	<u>QUINTALS</u>
Genoa Province	35.000	300
Imperia "	5.000	50
La Spezia "	36.000	1.000
Savona "	38.000	1.000
	<u>114.000</u>	<u>2.350</u>

3... It will be seen that there is a big difference between estimates by Ministry of Agriculture and by local Provincial Agricultural Officials and as the latter may be expected to be better acquainted with the conditions prevailing in their provinces it would seem that the Ministry of Agriculture has overestimated both the total crops and the total amassable for the Region.

4... The drought experienced during the Spring and early Summer together with the lack of fertilizers contributed principally to the low yield of wheat. There were, of course, other factors such as lack of seed, shortage of farm workers, the general alarm and feeling of insecurity caused by the approach of active combat operations and the incursions into the areas of irregular bands; the partial breakdown of administrative institutions; the aversion of farmers to grow wheat for which they will not receive an economic return and their lack of a sense of responsibility and obedience towards the law.

Genoa Province	65.000	300
Imperia	10.000	-
La Spezia	40.000	4.000
Savona	45.000	-
Total	165.000	4.300

On enquiry at the local Provincial Agricultural Offices (UPSEA), the following estimates have been received:-

<u>Production</u>	<u>Amassable</u>	<u>QUINTALS</u>
Genoa Province	35.000	300
Imperia	5.000	50
La Spezia	36.000	1.000
Savona	38.000	1.000
Total	114.000	2.350

It will be seen that there is a big difference between estimates by Ministry of Agriculture and by Local Provincial Agricultural Officials and as the latter may be expected to be better acquainted with the conditions prevailing in their provinces it would seem that the Ministry of Agriculture has overestimated both the total crops and the total amassable for the Region.

The drought experienced during the Spring and early Summer together with the lack of fertilizers contributed principally to the low yield of wheat. There were, of course, other factors such as lack of seed, shortage of farm workers, the general alarm and feeling of insecurity caused by the approach of active combat operations and the incursions into the areas of irregular bands; the partial breakdown of administrative institutions; the aversion of farmers to grow wheat for which they will not receive an economic return and their lack of a sense of responsibility and obedience towards the law.

The Region of Liguria comprises a narrow mountainous coastal strip where cultivation is carried out in small holdings. The official acreage available for wheat growing under the most favourable conditions total 26.000 hectares in Liguria and this is divided over 90.000 farms. Assuming(a) the total area were cultivated, and(b) a yield of 7 quintals per hectare, there would result 182.000 quintals, but after the legal retentions have been made for the farmer and his dependants from this production there will in general be no grain available for handing over to the ammassi. The only exception to this is in the southern extremity of La Spezia province where, near SARZANA there are two large farms at Larinelle and Casano owned by the Banking Institution Monte dei Paschi and it is from these two farms that the greater

13

part of the amassable wheat has been received in the Region. Unfortunately, the Germans had used this district as the Southern end of their last defence system and it suffered severely during the ensuing fighting, the land was extensively mined and the workers evacuated. From this comparatively favourable province for wheat amassing the wheat collected in 1942/43 which was the peak year for wheat amassing only totalled 5.000 quintals.

The total of grain amassed in the Region to date totals 1.705 quintals, approximately 40% of the quantity estimated by the Ministry of Agriculture on 15th. September. The collections are not yet completed and it is hoped that as a result of measures taken that another 500 quintals will be brought in, so that the total quantity finally collected will not be far short of the amount estimated by the local Provincial Agricultural Officers.

6...

HEADQUARTERS
ALLIED MILITARY GOVERNMENT
NAPLES COMMUNE
APO. 394

C/1730

10 December, 1945

SUBJECT : Grain Supplies.
TO : HQ. A. G.
(att. Food Sub-Commission).

1. The stock and supply of grain to Naples area has been the subject of anxiety as there has been danger that the basic ration of bread might not be maintained and this report is to provide information on this position.
2. Harvests - Returns for the 1945 harvest now reveal the failure of the Italian authorities to get in the grain grown in the country - see appendix "A" attached which shows the position of the provinces for which this office has liaison responsibilities. These figures are the more disastrous because the grain producing province of roggia (not included in the table as it is not one of Naples Commune liaison provinces) upon which South and Central Italy depends - has only shown a return of 20,246 Tons up to 15th November as against 118,913 Tons amassed by 15th November 1944.
3. Reasons for failure - The reasons for the failure of the harvest are given as drought and lack of fertilizers. When I look back, however, on the energetic measures taken up by A.M.G. HQ. in Naples in the Spring and early Summer of 1944, with the provisions of Italian soldier labour in roggia, vigorous action in law courts, etc., I feel sure that it is also the lack of this drive that has contributed to the position that has arisen. The result, whatever the cause, is that South West and Central Italy must rely on grain imported from elsewhere to maintain even the Allied Commission basic ration, local grain is lacking.

See M 8-70-11

9/11/45
(M.H.H.)

(b6)

4. Present Position of Imports - Unfortunately stocks have been allowed to fall to a very low level and in November a period occurred when there was less than 2,000 Tons of grain in the Castellammare Silos and (apart from an UNRRA stock of 2,600 Tons) less than 500 Tons of flour in the Naples Depots. Since then ships with nearly 23,000 Tons of grain have arrived. Part of this grain, though milled in Naples, is sent out to Rome, Frosinone, Latina, etc. besides the southern provinces of Potenza, Cosenza, Catanzaro, etc. From the above shipments over 15,000 Tons of flour have in fact to be sent North, viz.

to Rome	12,000 Tons + 500 for pasta
" Frosinone	1,000 " + 600
" Latina	1,000 " + 500

Monthly requirements for the 8 South West provinces are given in Appendix "B", and Naples alone requires about 17,000 Tons a month.

5. Shipping - Shipping in sight provides for a total of 51,000 Tons to Naples and satellite ports in December and 48,000 Tons in January 1946 (see FO-2FOOD of 20th and 26th November 1945). Although this will meet essential requirements I recommend that it be augmented to permit the building up of a reserve and in view of the failure of the harvest consider we require a reserve of 50,000 Tons of grain in the Castellammare silos as the present position is not too secure.

6. Distribution - Rail cars have not been forthcoming in sufficient quantities from the Italian State Railways and distribution in Naples has been slow and faulty. I have reported separately on the depots and owing to poor distribution; sugar, powdered milk, dried vegetables, etc. have been allowed to accumulate unduly. The distribution of pasta is also behind hand. It is most important that the distribution should be effected smoothly now as weather conditions may shortly produce delays and difficulties to aggravate the position.

1309

APPENDIX "A".

(6P)

For the 8 Southern Provinces (Caserta still not being shown separately) figures of grain in quintals amassed on 15th November were:

PROVINCE	15 Nov. 1945	15 Nov. 1944
NAPLES	10,888	39,981
AVELLINO	26,307	76,767
BENEVENTO	20,291 +	92,107
CAMPOBASSO	66,849	203,966
CATANZARO	56,751	107,198
COSENZA	11,860	72,974
REGGIO CALABRIA	3,584	2,828
SALERNO	13,590	36,938

* This figure to 31st October only.

APPENDIX "B"

(63)

Approximate grain requirements for South West Italy:

Province	Population	Approx. monthly requirements	Remarks
NAPLES	3,000,000	17,000 Tons	
AVELLINO	470,000	3,000 "	
BENEVENTO	360,000	2,000 "	Normally self- supporting
CAMPORASCO	420,000	2,500 "	do do
CATANZARO	606,000	4,000 "	
COSENZA	580,000	4,000 "	
REGGIO CALABRIA	600,000	4,000 "	
SALERNO	760,000	5,000 "	

Reserves of grain in Naples and satellite ports fall to less than 2,000 Tons in November 1945. Flour stocks on 30th November were about 200 Tons only with in addition 2,000 Tons of UNRRA flour.

Rome, 30 November 1946

My dear Admiral,

In relation with your proposal of October 9th A&R 331 to have the regulation prohibiting the publication of agricultural statistics revoked, I want you to know that, from a more general point of view, I realized the advisability of revoking such regulations as concern the suspension of the publication and spreading of all statistical data with an economic or financial character. A regulation will therefore shortly be drafted on such a matter.

Believe me,

Sincerely yours,

Petruccio Turri

SUBJECT: Wheat Amassing Liguria Region

TO : Regional Commissioner, Liguria Region

1. Reference is made to attached:

a) Copy of ref. 10.03/ES of 3 October 45, request of Economic Section to Supply Division (Agriculture S/C) for report on wheat amassing situation, Liguria.

b) Copy of ref. Agri/361 of 8 October 45, same being requested report.

2. This report gives the impression that wheat amassing activities in the Region have been almost the exclusive responsibility of the Italians. This may not be correct and if it is not the case then this impression should be corrected.

3. We in AMG are responsible for wheat amassing as long as the territory is under Allied Military Government. It is not enough to leave the matter in the hands of the Regional Agriculture Officer and the Italians. Organized and aggressive actions must be taken by the Regional Commissioner and his entire regional organization.

4. It is requested that a complete report be made, setting forth the position, and information submitted showing the activities that have been and are being taken by the AMG regional organization.

5. This is one of the most important functions, if not the most important, that we as AMG have yet to perform.

AGR/331

9 October 1945

OCT 10 1945

My dear Mister Prime Minister,

In certain of the areas of Northern Italy it has been proposed that a fuller presentation of agricultural statistics should be made, especially to acquaint the public with the progress of the grain collection campaign, and problems incidental thereto.

It appears that publication of basic statistics was temporarily suspended by the Fascist Government by their Confidential Circular No. 106 dated 4 September 1939, which has never been repealed or annulled. It seems appropriate to recommend action at this time to reinstate statistical information in its normal status of public property.

Possibly the matter is already receiving your consideration, but in any event I should like to point out that the repeal of Circular No. 106 would have an extremely beneficial effect in permitting a more accurate presentation of the situation to the people of Italy, and to other nations.

Very truly yours,

ELLIOT W. STONE

INTER OFFICE MEMORANDUM

Tel: 584

FEA/s1

Ref: 21-2/49/FOOD

2 October 1945

SUBJECT: Wheat for Sicily

FROM : Food Subcommission

TO : Economic Section
(Attn: Colonel WALTON)

1. On 2 October 45, a meeting was held in the Food S/C office at which were present Director Food Subcommission Lt Col. Toscani, Mr. Welk representing UNRRA, Major Haydon Chief Supply Officer of the Food Subcommission, Avv. Mole' Italian Minister of Food, Prof. Ronchi General Director of the Ministry of Food and Dr. Rogers Interpreter. Amongst the many things discussed was the wheat situation in Sicily. Minister Mole' declared that Palermo had only sufficient wheat/flour to last through October 5, 1945. A deep study was made of the situation and it was found that in Sicily from an initial provision for the amassing of 89,000 tons the figure was subsequently reduced to 56,000 tons and that as of the 15 September, was further reduced to 20,000 tons. The total accordingly amassed in Sicily as of 22 September, was 14,000 tons. The Minister gave many reasons for the continued changes in the provision figure, amongst which were the bad drought of this year plus the rather complicated political separatist movement going on in Sicily, obviously to embarrass the central government. The latter reason was also given for the non-amassing of grain. A solution was sought for which I contacted Colonel Walton, Colonel Densmore and eventually Brig. General McKinley. The decision reached by the three officers mentioned above was that the Sicilian situation was strictly an Italian Government affair and any decision would have to be made by that body. It was further said that if the fact that a wheat ship was late a few days made so much difference at the height of the amassing period, it sure would be very much worse next May and June. Therefore, I was instructed to notify the Minister of Food that the decision and solution was strictly up to him.

2. I returned to the conference and repeated General McKinley's words to the Minister of Food and asked him to please let me know what his decision would be for the record.

3. I am appreciative of the attitude taken by the Economic Section as I firmly believe that there is wheat in Sicily which is being held back from the amassi for political reasons and I believe it is high time that the Italian Government took some drastic action so as to get this wheat into the amassi.

SUBJ/OP: Amassing of Wheat

OCT - 1 1945

TO : Regional Commissioner, Piemonte Region

1. Reference your letter 041, subject as above, dated 13 September 1945.

2. The effort made to actively coordinate, strengthen and guide the Italian agencies responsible for the collection of wheat is gratifying. It is understood that considerable improvement has resulted from your efforts in this regard, especially in the realistic attitude of the officials concerned, and progressively greater flow of grain to the warehouses.

3. Your continued efforts in this regard will no doubt relieve the seriousness of the food situation in Piemonte Region to an appreciable degree, and will certainly mean that the Italian officials are much better prepared to administer the area when it returns to the jurisdiction of the Italian Government.

Translation

To Admiral Stone

and for the attention of the President of the Council
the Ministers of Alimentation and Agriculture

GFD

As a miller, I think it is my duty to bring to your attention what I hear from the producers of wheat, on the lack of wheat and its serious consequences. They blame it on the Government for the following reasons:

1) There is and will be less and less wheat for the cost, manpower, taxes, etc. amount to about 70 lire a Kg. while we are obliged to hand it over to the 'Ammasso' for 9 or 10 lire.

We are therefore obliged to sow and hand over as little wheat as possible.

2) If the Government raised the price of the wheat to the cost price, and this before the sowing season, if it unblocked the rest, barley, beans, etc., we would sow all the land, and have a crop that would make it possible to increase the bread ration, and curb black market.

3) The daily salary of farmhands should be blocked till the next harvest, not to increase the cost of wheat. The Government should legally forbid the usual form of blackmail that farmhands use during the grape harvest, the sowing season, etc; the minimum salary is of 300 lire; if you want us, give us 400 lire, bread, plenty of white pasta (to be bought on the black market) and a liter of wine or more.

4) The Government should establish death penalty for the professional gangsters, with military armament, handbombs, tommy-guns, etc, who disregard the C.R.R. and steal our wheat, fruit, and also our cattle, which they slaughter and sell on the black market.

5) The Govt. could supply corn for the sowing,

6) threshing machines from the States, with their spare pieces,

7) string (spago) for the threshing machines.

About the proposal of the Minister of Agriculture to the Council of Ministers, all landowners, are unanimous in wishing to know, before the sowing season, i.e. before bearing the expenses as from enclosure, the new price of wheat, keeping in mind that, for an hectare of land, the necessary funds to be spent are of 240,40 lire.

Trusting you will kindly take this note in consideration, I remain,

Sincerely yours,

s. Salvatore Patruno

ACR/861

21 September 1945

SEP 22 1945

SUBJECT: New Italian Ammassi Plans

TO : Chief Commissioner

1. There have been considerable press comments about a revision in the present "ammassi." The proposed changes reflect the views of Undersecretary Segni of the Ministry of Agriculture, who has indicated more originality of thought and over-all interest in the crop collection work than any of the other officials.

2. The basic feature of the new scheme is to allocate to the compartments, provinces and communes a proportionate share of the quantities of cereals assessed during the past two or three years when the total collection has been low. During that time production has fluctuated but the quantity collected was appreciably lower than when the ammassi was at its peak. The allocation of goals to the communes would, therefore, provide for the collection of as much wheat as is now being collected by the present laws - but any additional production would be at the disposal of the farmer.

3. Since wheat which does not move through controlled channels brings the farmer a very much higher price, Segni feels that the opportunity to produce and sell such additional quantities as could be produced would provide an incentive to the farmer, the net result being a considerably increased total production in Italy. (It has been pointed out that to make this scheme workable it would be necessary to provide the farmer with fertilizer and equipment with which to increase his production.)

4. Undersecretary Segni further contends that, unless some such scheme is proposed and accepted before the fall planting season, the farmers will devote more acreage to uncontrolled crops which will bring a greater per hectare return. He therefore proposes to give the matter fullest consideration prior to the fall planting season, since the present controlled price of wheat is so unsatisfactory to the farmers.

5. This scheme was proposed last spring, to permit some incentive factor in the crop collection program, but was abandoned since justification for the import program took into account control of all

(b)

wheat in Italy. Since wheat is no longer "controlled," the proposal seems to warrant consideration. Segni contends that as much wheat would be collected as at present, and more would be produced - with the collection targets established to provide a 300-gram issue from domestic and imported wheat.

MR/810

31 August 1945

My dear Mr. Prime Minister:

SEP 1 1945

Acknowledging your letter of 16 August, I can assure you that various agencies of the Allied Governments are giving fullest consideration to the problems incidental to increasing the shipments of wheat to Italy. Of course, since similar conditions prevail in many areas, the problem of increased imports to Italy is proportionately more difficult. The requirements for imported wheat have, however, been considered with due regard to the minimum food requirements of Italy.

The efforts of the Italian Government to increase the efficiency of the collection of domestic wheat is gratifying. It is most important that the maximum amount must be held in storage to provide for the needs of the various areas, especially since such domestic stocks will be the only basis for the maintenance of the ration in the event of any delay or interruption in the scheduled imports. In this connection, Regional Commissioners are giving their fullest attention to the lack of aggressive action to collect the wheat produced in certain provinces of the North, and doubtless the Italian Government is taking similar action in certain of the Southern provinces.

On the other hand, collections to date of some provinces of almost every compartment are reported to be proportionately high. There is reason to believe that the major wheat producing areas, except Foggia, are in a position to contribute more grain to the Granai del Popolo than was originally expected. Hence, continued aggressive action to implement the Granai del Popolo campaign should result in the collection of adequate domestic stocks with which to maintain the ration program, if provision can be made for imports to be continued at the present level.

The program as from the end of December is not yet established -- hence the necessity for a maximum reserve stock of domestic wheat. It is, therefore, recommended that the several Ministries continue to render all possible assistance to the Ministry of Agriculture in its grain collection program. I shall be glad to receive your further comments on the situation from time to time, and can assure you that the matter is receiving the continued attention of the Allied Commission.

Yours very truly,

HILLERY W. STONE

 Regional Commissioner - Venezia Region
 Regional Commissioner - Liguria Region
 S.C.A.O. Venezia Giulia (for info)

1. The North is considered as self-sufficient in respect to grain; therefore, once again the extreme urgency of putting all possible emphasis on the amassing program is being brought to your attention.

2. It is embarrassing to note that the 3 September 1945 Wheat Amassing Report (copy inclosed) shows that the average collection to that date for all AMG territory is 33% as compared to an average of 55% in Central, Southern and Insular Italy.

3. The provinces of Alessandria, Cuneo and Torino of Piemonte; Como, Milano and Varese of Lombardia; and Bolzano, Belluno, Treviso and Verona of Venezia, are especially low in collections to date. The Chief Commissioner desires that these provinces be given special attention during the balance of AMG occupation. Please review the discrepancies between AMG and UNSEA production estimates with a view to their reconciliation. A report is desired on the action taken to reduce the inconsistent variations with regard to amounts collected to date which exist between provinces.

4. A strong justification based on exceptional circumstances will be necessary before any authorization will be given for the transfer of wheat into areas where requirements are unassassable but where amassing has failed. The present rate of imports does not provide wheat for areas deemed self-sufficient.

FVB:ps

Ref. AGR/861

5 September 1945

Dear Avv. Gallo:

Our latest figures on amassing show that total collections on 3 September 1945 represent 50% of the amassable wheat in all of Italy. It was our understanding that the 50% collection figure is usually arrived at by the middle of August; hence, this indicates that the amassing program is not progressing at the normal rate.

The import tonnage of wheat has been based upon successful amassing, therefore, if the Italian rations are to be maintained it is essential that a full amassing job be done by the responsible agencies. I have again enjoined regional officers to intensify their work on amassing.

Piemonte Region has issued Regional Order No. 9 which restricts the sale of fertilizers to only those persons who have filled out the denuncia form and have delivered to the Federazione Italiana dei Consorzi Agrari all of the portion of their crops to be amased for Granai del Popolo. It is suggested that similar steps might be taken in Central, Southern and Insular Italy.

It is hoped that you will increase your efforts for a full amassing job, since it is questionable whether any wheat should be sent to areas where there is a deficit in amassing.

Yours very truly,

The President of the Council of Ministers
1,08,2

Rome, 10 August 1945

AUG 21 1945

Dear Admiral,

I refer to your letter of June 30th, in which you had to draw the attention of the Government on the repercussions which might come from the bad results of the crop, with special effects in the financial and social fields, as well as in that of public health and public safety.

As a matter of fact, it has been figured out, not definitively, and of course approximately, that the total amount of the present harvest would be of qts. 42.101.320. instead of qts. 65.8 3.010. in 1944, with a difference of qts 21.742.290 amounting to about 31%. It must be said that accurate control investigations which might bring some changes in the above mentioned data are being made.

On the other hand, conscious of the enormous difficulties which had to be coped with in many regions for the culture of wheat, because of the damages made by the enemy or the duration of the war operations, the Government made use of all the means at its disposal to give the greatest possible impulse to the wheat campaign, intensifying the regulations made to assure the delivering of the produced wheat to the 'ammassi'. To this end, those who hand over their wheat will have special advantages, which, practically, limit in a considerable way the disadvantage caused by the low price of wheat.

Such regulations have made the compulsory handing over less prejudicial for the producers, and from now on, the transgressors will be severely punished.

It would be useless to hide the fact that it is necessary for the amount of the national harvest, which has naturally been prejudiced by the extreme difficulties of the production which took place in war time, to be completed by an adequate amount of imported wheat. We do not see what other means might be employed to prevent a famine, of which you indicated with such perspicacity the unavoidable consequences from the social point of view.

I shall therefore be most grateful, my dear Admiral, if you kindly draw the particular attention of the A.C. and of the Allied Governments on this requirement.

I shall send you further and more accurate informations on the matter

AGRICULTURAL SUB-COMMISSION

1945 ITALIAN CROP REPORT
15 JULY 1945

This report is based upon data supplied by the Ministry of Agriculture field organization, acting in AMG territory under the supervision of the AMG Regional Agricultural Officers, and supplemented by observations made by Allied survey parties in Central and Southern Italy, Sicily and Sardinia during the last week of June and first two weeks of July 1945. The report revises the "1945 Italian Year Crop Estimate" of 15 June 1945, to the extent that it has been practicable to review those data during the harvest period, and to evaluate the effect of the weather through 1 July. The Italian crop reporting organization is overburdened and under-equipped, with the shortage of transportation restricting their ability to develop detailed information on relatively minor crops. Their efforts are further handicapped by disputes regarding the division of the crop between landlord and tenant, and general unrest in the producing areas which can be attributed to the reduction in the crop and the income of the farmers.

It has been possible to supplement the data developed by the Ministry of Agriculture with reports from survey parties, etc thereby obtain an estimate of the situation regarding all of the important field crops. The estimates are of a general nature, except in instances where it has been practicable to carry out a detailed study. While the estimates are adequate for planning purposes, the figures submitted may be modified if an opportunity occurs for detailed study of an individual crop.

Quantitative estimates of agricultural production other than field crops, such as livestock and livestock products, are considerably more difficult to obtain. Normally, a census of livestock is taken on 20 July. Such a census has been scheduled in AMG territories, and the Italian Government has been advised of the desirability of such a census in the remainder of the country. However, the practicability of an accurate census is doubtful in view of the lack of transportation, the problem of controlling the current grain collection campaign, and abnormal factors such as the foreign shortage which is increasing the slaughter, and the presence of captured livestock, stray livestock, etc. Accordingly, no data are submitted regarding livestock products. Since the latter is not yet stabilized to a degree which will permit accurate evaluation. The situation is receiving attention, and reports will be developed at a later date.

As of 15 July 1945, the general crop situation in Italy was not deteriorating, although there were to wheat and other cereal crops, except corn and rice, was essentially as forecast in the 15 June 1945 report. The ~~Japanese~~ has resulted from conditions prevailing in March, April and May, as previously reported. Unless fertilizers are available, both nitrogen and phosphorous, the succeeding crops can be

785017

Regional Agricultural Officers, and supplemented by observations made by Allied survey parties in Central and Southern Italy, Sicily and Sardinia during the last week of June and first two weeks of July 1945. The report revises the "1945 Italian Wheat Crop Estimate" of 15 June 1945, to the extent that it has been practicable to review those data during the harvest period, and to evaluate the effect of the weather through 1 July. The Italian crop reporting organization is overburdened and under-equipped, with the shortage of transportation restricting their ability to develop detailed information on relatively minor crops. Their efforts are further handicapped by disputes regarding the division of the crop between landlord and tenant, and general unrest in the producing areas which can be attributed to the reduction in the crop and the incore of the farmers.

It has been possible to supplement the data developed by the Ministry of Agriculture with reports from survey parties, and thereby obtain an estimate of the situation regarding all of the important field crops. The estimates are of a general nature, except in instances where it has been practicable to carry out a detailed study. While the estimates are adequate for planning purposes, the figures submitted may be modified if an opportunity occurs for detailed study of an individual crop.

Quantitative estimates of agricultural production other than field crops, such as livestock and livestock products, are considerably more difficult to obtain. Normally, a census of livestock is taken on 26 July. Such a census has been scheduled in AMG territory, and the Italian Government has been advised of the desirability of such a census in the remainder of the country. However, the practicability of an accurate census is doubtful in view of the lack of transportation, the problem of controlling the current grain collection campaign, and abnormal factors such as the foreign shortage which is increasing the slaughter, and the presence of captured livestock, stray livestock, etc. Accordingly, no data are submitted regarding livestock products. Since this latter is not yet stabilized to a degree which will permit accurate evaluation. The situation is receiving attention, and reports will be developed at a later date.

As of 15 July 1945, the general crop situation in Italy was not deteriorating, although damage to wheat and other cereal crops, except corn and rice, was essentially as forecast in the 15 June 1945 report. The damage has resulted from conditions prevailing in March, April and May, as previously reported. Unless fertilizers are available, both nitrogen and phosphorous, and the necessary tillage and harvest machinery, the succeeding crops can be expected to further decline. The weather during late June and July, normally the "dairy" season, has not been abnormal. Scattered showers have covered most of the Po Valley, and certain other mountain areas where summer rainfall is characteristic, but the majority of the country has not received rain, and will not until the rainy season starts in October. The situation with regard to each of the basic crops is summarized below, with more detailed presentation of the relative position in the various areas outlined in Appendix A, "Area Crop Report." The wheat situation is treated in Appendix B, with more detailed information and revised tribular projection of all data. A recent survey of the forage situation is presented in Appendix C.

Wheat, Barley and Rye

The wheat crop is now estimated at 4,188,583 metric tons, a reduction of 256,412 metric tons from the report of 15 June 1945. The revised data indicate a larger acreage but a smaller yield per acre. Drought damage ranged from slight to severe, due to the factors outlined in the above mentioned report. The barley crop is estimated to have totalled 138,000 metric tons, and rye totalled 86,400 metric tons. Factors which reduced the production of wheat are applicable to barley and rye as well.

Corn

The main crop of corn is estimated at 2,165,000 metric tons, to be supplemented by a summer corn crop, which may total 200,000 metric tons in the Po Valley. The acreage planted has been estimated at 120% of normal in Northern Italy, but no such increase is reported from other areas. The increased planting was due to the inability of the farmers to complete the planting of wheat in the fall of 1944, hence more land was planted to corn in the spring of 1945. Drought conditions threatened severe damage to the crop, but the damage in major producing areas has been largely limited to late planted fields. Detailed information as to acreage planted is not available, nor is the danger of drought damage past. However, the increased acreage warrants the assumption that the total crop will be not less than normal, although plantings south of the Apennines, especially in upland areas, will contribute little to the local food supply.

Rice

Since the production of rice is concentrated in Northern Italy, and not susceptible to drought damage, the present crop is estimated at 410,000 metric tons. The considerable reductions in acreage and yield are largely due to difficulties at planting time, when a great deal of migratory labor is required for seeding and transplanting.

Legumes

The legume crop has apparently suffered more damage than any other, since heavy fertilization is required to maintain the fava production in Southern Italy, and plantings last fall were reduced by the lack of fertilizer. Next, severe frosts in May damaged plantings in the heavy producing areas of Northern Italy. Finally, drought damage was severe, except in Northern Italy and irrigated plantings in the remainder, and eliminated the large surpluses normally produced in Foggia and other upland surplus-producing areas. Small plantings of legumes will provide for the requirements of many farmers, but quantities surplus to the requirements of the producer have largely disappeared, owing to the over-all scarcity in every area. The total yield of fava is estimated to have been 166,000 metric tons, and of all other legumes approximately 161,000 metric tons.

Sugar Beets

The main crop of corn is estimated at 2,165,000 metric tons, to be supplemented by a summer corn crop, which may total 200,000 metric tons in the Po Valley. The acreage planted has been estimated at 120% of normal in Northern Italy, but no such increase is reported from other areas. The increased planting was due to the inability of the farmers to complete the planting of wheat in the fall of 1944, hence more land was planted to corn in the spring of 1945. Drought conditions threatened severe damage to the crop, but the damage in major producing areas has been largely limited to late planted fields. Detailed information as to acreage planted is not available, nor is the danger of drought damage past. However, the increased acreage warrants the assumption that the total crop will be not less than normal, although plantings south of the Apennines, especially in upland areas, will contribute little to the local food supply.

Rice

Since the production of rice is concentrated in Northern Italy, and not susceptible to drought damage, the present crop is estimated at 410,000 metric tons. The considerable reductions in acreage and yield are largely due to difficulties at planting time, when a great deal of migratory labor is required for seeding and transplanting.

Legumes

The legume crop has apparently suffered more damage than any other, since heavy fertilization is required to maintain the fava production in Southern Italy, and plantings last fall were reduced by the lack of fertilizer. Next, severe frosts in May damaged plantings in the heavy producing areas of Northern Italy. Finally, drought damage was severe, except in Northern Italy and irrigated plantings in the remainder, and eliminated the large surpluses normally produced in Puglia and other upland surplus-producing areas. Small plantings of legumes will provide for the requirements of many farmers, but quantities surplus to the requirements of the producer have largely disappeared, owing to the over-all scarcity in every area. The total yield of fava is estimated to have been 166,000 metric tons, and of all other legumes approximately 161,000 metric tons.

Sugar Beets

The production of beets for sugar was drastically curtailed due to the lack of processing facilities, coal, etc., and the planting program was restricted in the North to 9,630 acres in the then liberated areas, and combat operations limited it to 34,333 acres, and subsequent damage from the drought has sharply reduced this acreage under cultivation and the yield, except in irrigated areas, so that the total yield of beets is now estimated to be 275,000 metric tons. Most of the land in the Holocene and Naples areas was either unplanted, or the crop has failed owing to the drought. On the other hand, excellent fields of beets are to be found in irrigated areas, such as the Aterzino Valley.

785017

Hemp

The acreage of hemp is estimated to be 50% of normal, plantings suffered from drought and lack of fertilizer. The crop has estimated to be 45,000 metric tons from 111,150 acres planted.

Hay, including Alfalfa

The damage to the hay crop ranges from moderate to extremely severe. Northern areas were frosted, but the over-all damage from the lack of spring rains is especially apparent south of the Apennines, becoming most severe in Apulia and Sardinia. Early cuttings were fairly successful, but the later cuttings yielded little. The total hay crop is estimated at 17,000,000 metric tons, 60% of normal. Hence, the over-all position is one of scarcity, reaching critical prospects in some areas. Pastures are damaged to approximately the same extent. The situation requires redistribution of livestock, as well as forage, and transportation is so limited that slaughtering has already increased to bring the herds in line with the local availability of forage.

Fruits and Fresh Vegetables

Fruit and fresh vegetable production, while less than normal, has been adequate to maintain a good supply in all of the major consuming centers. Quantitative information is not available, but the product has not suffered because the majority of plantings are on irrigated land. Approximately 50,000 metric tons of early fruit will be available in the North, and up to 80,000 metric tons of apples and pears. The difficulty of marketing perishable fruit to distant markets, especially soft fruit, prevents fullest utilization, although producing areas will have an ample supply of cheap fruit. The grape crop is in excellent condition due to dry weather which prevents the spread of disease. Vegetable production is adequate to meet local requirements, even in Sardinia. However, the citrus crop is not in good condition, and insecticides, fumigants and fertilizers are required to maintain commercial production.

There is evidence of extensive tomato planting. Though the quality of the fruit is not up to par, there is promise of a good yield, probably 900,000 metric tons. The scarcity of good seed potatoes and fertilizer will reduce this year's crop. While only the early crop has been harvested, the main crop prospects are generally nearly normal. The current estimate for the total potato crop is 2,500,000 metric tons.

Olives

The olive crop this year is expected to be less than last year. It is normal for a large crop to be followed by a smaller crop. Last year was a large crop. The drought has caused some of the olives to fall from the trees. The crop varies somewhat, but it is approximately normal for the "off" year. The olives are still small and it is too early

785017

There is especially apparent south of the Apennines, becoming most severe in Apulia and Sardinia. Early cuttings were fairly successful, but the later cuttings yielded little. The total hay crop is estimated at 17,000,000 metric tons, 60% of normal. Hence, the over-all position is one of scarcity, reaching critical prospects in some areas. Permanent pastures are damaged to approximately the same extent. The situation requires redistribution of livestock, as well as forage, and transportation is so limited that slaughtering has already increased to bring the herds in line with the local availability of forage.

Fruits and Fresh Vegetables

Fruit and fresh vegetable production, while less than normal, has been adequate to maintain a good supply in all of the major consuming centers. Quantitative information is not available, but the production has not suffered because the majority of plantings are on irrigated land. Approximately 50,000 metric tons of early fruit will be available in April, and up to 80,000 metric tons of apples and pears. The difficulty of moving perishable fruit to distant markets, especially soft fruit, prevents fullest utilization, although producing areas will have an ample supply of cheap fruit. The grape crop is in excellent condition due to dry weather which prevents the spread of disease. Vegetable production is adequate to meet local requirements, even in Sardinia. However, the citrus crop is not in good condition, and insecticides, fumigants and fertilizers are required to maintain commercial production.

There is evidence of extensive tomato planting. Though the quality of the fruit is not up to par, there is promise of a good yield, probably 900,000 metric tons. The scarcity of good seed potatoes and fertilizer will reduce this year's crop. While only the early crop has been harvested, the main crop prospects are generally nearly normal. The current estimate for the total potato crop is 2,500,000 metric tons.

Olives

The olive crop this year is expected to be less than last year. It is normal for a large crop to be followed by a smaller crop. Last year was a large crop. The drought has caused some of the olives to fall from the trees. The crop varies somewhat but it is approximately normal for the "off" year. The olives are still small, and it is too early in the season to predict the final production, since the sirocco winds may still materially reduce this year's crop. The crop may therefore total up to 950,000 metric tons of olives.

APPENDIX A

Area Crop Report

In view of the damage which has resulted from drought conditions during the spring, the country must be divided into zones for consideration of the present situation. There are certain natural variations from north to south which are accentuated by the drought to a degree which warrants recognition of the different areas.

North of the Po River, including Piemonte

Conditions are relatively good, especially since rains covered the areas fairly generally in late June and early July. The area produces wheat, corn, rye, rice, hay and deciduous fruits. Corn, rice and rye are extremely important, since 69, 93 and 30% of the total production of those crops in Italy are located in that area. The hay assumes more than ordinary importance since essentially all of this year's surpluses are in that area.

Wheat, Barley and Rye

Cereal crops were damaged by the spring drought, frost, and lack of fertilizer. Wheat production reported from the provinces north of the Po River is 38% below 1944, 37% below 1943, with an estimated yield per hectare of 15.2 quintals in 1945. The total production of wheat is estimated to be 1,327,424 metric tons, rye 70,000 metric tons, and barley 16,000 metric tons.

Corn

On the other hand, the acreage planted to corn (early crop) is 10% greater than 1944, 15% greater than 1943, and the crop is not appreciably damaged by the drought. Conditions favor the production of a satisfactory late crop of corn, since the summer rains have been sufficient to insure moisture enough to permit germination of the corn planted after wheat. The total production is estimated to be 1,300,000 metric tons, including summer corn, an important crop in this area.

Rice

The rice crop is reduced in acreage and yield largely due to difficulties at planting time. The present crop is estimated at 387,000 metric tons.

Legumes

The normal production of legumes is small, averaging 75,000 metric tons. The crop this year was damaged by severe frosts in May and re-planting was handicapped, due to lack of seed. There was no appreciable damage from the drought. The fall crop harvested is estimated to have been 4,000 metric tons, and other legumes are expected to yield a total of 10,000 metric tons.

0 7 4 2

Conditions are relatively good, especially since rains covered the areas fairly generally in late June and early July. The area produces wheat, corn, rye, rice, hay and deciduous fruits. Corn, rice and rye are extremely important, since 69, 93 and 30% of the total production of those crops in Italy are located in that area. The hay assumes more than ordinary importance since essentially all of this year's surpluses are in that area.

Wheat, Barley and Rye

Cereal crops were damaged by the spring drought, frost, and lack of fertilizer. Wheat production reported from the provinces north of the Po River is 35% below 1944, 37% below 1943, with an estimated yield per hectare of 15.2 quintals in 1945. The total production of wheat is estimated to be 1,327,424 metric tons, rye 70,000 metric tons, and barley 16,000 metric tons.

Corn

On the other hand, the acreage planted to corn (early crop) is 10% greater than 1944, 15% greater than 1943, and the crop is not appreciably damaged by the drought. Conditions favor the production of a satisfactory late crop of corn, since the summer rains have been sufficient to insure moisture enough to permit termination of the corn planted after wheat. The total production is estimated to be 1,300,000 metric tons, including summer corn, an important crop in this area.

Rice

The rice crop is reduced in acreage and yield largely due to difficulties at planting time. The present crop is estimated at 387,000 metric tons.

Legumes

785017
The normal production of legumes is small, averaging 75,000 metric tons. The crop this year was damaged by severe frosts in May and re-planting was handicapped, due to lack of seed. There was no appreciable damage from the drought. The few crop harvested is estimated to have been 4,000 metric tons, and other legumes are expected to yield a total of 40,000 metric tons.

Sugar Beets

The acreage of sugar beets in this area is small, but no critical damage has been reported to the plantings north of the Po River, and the total crop is estimated at 100,000 metric tons.

Hops

Production in this area is negligible.

785017

Hay, including Alfalfa

The hay crop north of the Po River was damaged slightly by the lack of spring rains and by frost, particularly upland meadows of common hay. Alfalfa plantings suffered to a lesser degree with only the second cutting appreciably affected. The total hay crop is estimated at 9,000,000 metric tons. Permanent pastures are in poorer condition than the meadows.

Fruits and Fresh Vegetables

Fruits of all kinds were damaged by the spring frost, but not seriously, and large surpluses now exist. Adequate spray protection has been maintained. The supply of fresh vegetables is adequate, since they are largely produced in irrigated areas, and must be consumed close to the producing areas.

From the Po River to the Apennines (Emilia), and Liguria

South of the Po River drought damage is most severe in the Forlì and Ravenna area, but damage to cereal crops was not appreciably greater than in the areas north of the Po River. Combat operations during the winter and spring prevented the cultivation of relatively large areas in Ferrara and Bologna Provinces. This area includes most important wheat-producing districts, and the majority of the hemp and sugar beet acreage, much of which is produced on reclaimed land.

Wheat, Barley and Rye

Production of wheat from Emilia and Liguria is 48% below 1944, 45% below 1943, with an estimated yield per hectare of 44.2 quintals in 1945. However, the reduction in the yield is largely due to reduced acreage in the Winter Linen areas of Ravenna, Forlì, Ferrara and Bologna Provinces, where the acreage is reduced 29%, which eliminated a potential production of 121,000 metric tons. The total production is estimated to be 612,797 metric tons of wheat, 15,000 metric tons of barley and 1,400 metric tons of rye.

Corn

While the sorgo planted to corn (early crop) is 15% greater than 1943, and early plantings were not appreciably damaged by the drought, later plantings have suffered appreciably. Unless rains in late July provide additional moisture, the acreage planted to the summer crop of corn will be reduced due to lack of moisture to germinate the seed planted after wheat. The total production is estimated to be 200,000 metric tons.

Pige

Production in this area is estimated to be 19,000 metric tons, con-

C 7 4 4

largely produced in irrigated areas, and must be consumed close to the producing areas.

From the Po River to the Apennines (Emilia), and Liguria

Scarcity of the Po River drought damage is most severe in the Forlì and Ravenna areas, but damage to cereal crops was not appreciably greater than in the area north of the Po River. Combat operations during the winter and spring prevented the cultivation of relatively large areas in Ferrara and Bologna Provinces. This area includes most important wheat-producing districts, and the majority of the hemp and sugar beet acreage, much of which is produced on reclaimed land.

Wheat, Barley and Rye

Production of wheat from Emilia and Liguria is 48% below 1944, 45% below 1943, with an estimated yield per hectare of 14.2 quintals in 1945. However, the reduction in the yield is largely due to reduced acreage in the Winter Lino areas of Ravenna, Forlì, Ferrara and Bologna Provinces, where the acreage is reduced 29%, which eliminated a potential production of 121,000 metric tons. The total production is estimated to be 612,797 metric tons of wheat, 15,000 metric tons of barley and 1,400 metric tons of rye.

Corn

While the acreage planted to corn (early crop) is 15% greater than 1943, and early plantings were not appreciably damaged by the drought, later plantings have suffered appreciably. Unless rains in late July provide additional moisture, the acreage planted to the summer crop of corn will be reduced due to lack of moisture to germinate the seed planted after that date. The total production is estimated to be 200,000 metric tons.

Rice

Production in this area is estimated to be 19,000 metric tons, conditions being as in the major areas north of the Po.

Legumes

The normal production of legumes is small, totalling 17,000 metric tons. The crop this year was affected by the drought, and by combat operations, essentially as indicated for wheat and substitute cereals. The fall harvest is estimated to have been 2,300 metric tons, and other legumes are expected to yield a total of 5,000 metric tons.

Sugar Beets

The acreage of sugar beets in this area is normally very large, but this year the major producing areas did not plant, due to combat operations, damage to the factories, flooding, etc. Such acreage as was started was severely damaged by lack of rain, and the total production is now estimated at 100,000 metric tons.

Hemp

The hemp crop, normally large in the Bologna-Ferrara area has suffered appreciably from the drought and lack of fertilizer. The acreage there is down 50%, and the estimated production of hemp fibre is 32,000 metric tons for the area.

Hay, including Alfalfa

Drought damage to the hay crop was appreciable throughout the area, especially in the Forlì-Ravenna Provinces. The later cuttings of alfalfa were severely damaged, especially when inter-planted with trees and vines. The total hay crop is estimated at 2,500,000 metric tons. Permanent pastures are in essentially the same condition as the meadows.

Fruits and Fresh Vegetables

Fruits of all kinds are essentially undamaged, and have received adequate spray protection, except in the areas involved in combat operations. The supply of fresh vegetables is adequate, since they are largely produced in irrigated areas, and must be consumed close to the producing areas.

Central, Southern and Insular Italy (except Apulia and Sardinia)

Drought damage becomes increasingly severe from the Apennines south, with "hill" areas effected more than "mountain" or "plains" areas. Throughout the area indicated the damage was appreciably greater than that which occurred in the Po Valley, except the provinces of Forlì and Ravenna. Damage due to combat operations still exerts a considerable influence in areas such as the Arno River Valley. The land is generally deficient in fertilizer and susceptible to drought. Inter-cropping and over-cropping accentuate these conditions. Marginal farm land, especially that which is planted to tree crops as well as field crops, has been extremely unproductive.

Wheat, Barley and Rye

Production of wheat from the provinces indicated is 25% below 1944, 26% below 1943, with an estimated yield per hectare of 7.5 quintals in 1945. The reduction in yield is due to failure of the crop when inter-planted with tree crops which consume the available moisture, and to moderate to severe drought damage to all crops not well suited to cereals. Poor prospects for grain, and a shortage of forage, resulted in grazing some fields, rather than attempting to save the crop for threshing. The total production is estimated to be 2,065,352 tons, which is made up of 1,969,352 metric tons of wheat, 81,000 metric tons of barley, 15,000 metric tons of rye.

785C17

Drought damage to the hay crop was appreciable throughout the area, especially in the Forlì-Ravenna Provinces. The later cuttings of alfalfa were severely damaged, especially when inter-planted with trees and vines. The total hay crop is estimated at 2,500,000 metric tons. Permanent pastures are in essentially the same condition as the meadows.

Fruits and Fresh Vegetables

Fruits of all kinds are essentially undamaged, and have received adequate spray protection, except in the areas involved in combat operations. The supply of fresh vegetables is adequate, since they are largely produced in irrigated areas, and must be consumed close to the producing areas.

Central, Southern and Insular Italy (except Apulia and Sardinia)

Drought damage becomes increasingly severe from the Apennines south, with "hill" areas affected more than "mountain" or "plains" areas. Throughout the area indicated the damage was appreciably greater than that which occurred in the Po Valley, except the provinces of Forlì and Ravenna. Damage due to combat operations still exerts a considerable influence in areas such as the Arno River Valley. The land is generally deficient in fertilizer and susceptible to drought. Inter-cropping and over-cropping accentuate these conditions. Marginal farm land, especially that which is planted to tree crops as well as field crops, has been extremely unproductive.

Wheat, Barley and Rye

1282
Production of wheat from the provinces indicated is 25% below 1944, 26% below 1943, with an estimated yield per hectare of 7.5 quintals in 1945. The reduction in yield is due to failure of the crop when inter-planted with tree crops which consume the available moisture, and to moderate to severe drought damage to all areas not well suited to cereals. Poor prospects for grain, and a shortage of forage, resulted in grazing some fields, rather than attempting to save the crop for threshing. The total production is estimated to be 2,065,352 tons, which is made up of 1,969,352 metric tons of wheat, 81,000 metric tons of barley, 15,000 metric tons of rye.

Corn

The acreage planted to corn was essentially unchanged from 1944, but the production of corn in this area is not large since the varieties are low-yielding flint types, except on irrigated land in the Naples area. Damage to the corn crop has been less severe than the damage to other cereals, but many plantings on poor land failed to make a crop. The total yield is estimated to be not more than 350,000 metric tons, 21% above 1943 production.

Rice

Production in this area is of little commercial importance. This year's crop is estimated at 4000 tons, - 10% of normal.

785017

Lentils

The total production is estimated to be 110,000 metric tons of favo and 100,000 metric tons of other legumes. 1945 production is estimated at 70% of 1944, which was an extremely low year (1944 production was estimated at only 43% of the average for 1936-38). The crop has suffered from lack of fertilizer, and from drought.

Sugar Beets

There is normally a considerable production of sugar beets in this area, but the acreage planted for this season was reduced to 9,633 acres, largely due to lack of processing facilities. Drought conditions further reduced the acreage planted, and has since damaged the majority of the crop, except in the Arrezzano area. The production is estimated to be 75,000 metric tons.

Hemp

The hemp crop in the Naples area is not in as good condition as last season, having suffered from the drought appreciably more than the crop in the Bologna-Ferrara area. However, the acreage is not reduced, and the yield is estimated to average 10 quintals per hectare and to represent a total crop of approximately 13,000 metric tons. Hemp in other areas is of little consequence, except as required for home industry, and is not seriously affected by the drought because it is usually planted in favorably situated areas.

Hay, including Alfalfa

In all of the areas, the early hay crop suffered from the lack of spring rains with considerable damage in upland meadows of common hay. Early cuttings of alfalfa yielded well but later cuttings failed completely, except on irrigated fields. Permanent pastures dried up 4-6 weeks earlier than normal, and roadsides were almost universally brown by the first of July. The total hay crop of the area is estimated at 5,000,000 metric tons. In this connection, straw is widely used as a supplement to hay and the damage to the wheat crop has resulted in a 25% reduction in the straw available from upland fields in Toscana, Campobasso and Calabria.

Fruits and Fresh Vegetables

Fruits were little damaged by the drought, and grapes are in good condition, having received reasonably adequate spray protection in this dry season. Deciduous fruits are of poor quality; except in specialized plantings, but the supply is adequate to meet all demands, especially in view of the limited facilities for moving soft fruits to distant markets. Citrus fruits are in need of additional protection from seaio insects, and are suffering from the shortage of nitrogen fertilizer, conditions which will necessitate further action in order to insure a good quality crop. The supply of fresh vegetables is adequate, since they are largely produced in irrigated areas, and must be consumed close to the producing areas.

O 7 4 3

the crop, except in the Avellino area. The production is estimated to be 75,000 metric tons.

Hemp

The hemp crop in the Naples area is not in as good condition as last season, having suffered from the drought appreciably more than the crop in the Bologna-Ferrara area. However, the acreage is not reduced, and the yield is estimated to average 10 quintals per hectare and to represent a total crop of approximately 13,000 metric tons. Hemp in other areas is of little consequence, except as required for home industry, and is not seriously affected by the drought because it is usually planted in favorably situated areas.

Hay, Including Alfalfa

In all of the areas, the early hay crop suffered from the lack of spring rains with considerable damage in upland meadows of common hay. Early cuttings of alfalfa yielded well, but later cuttings failed completely, except on irrigated fields. Permanent pastures dried up 4-6 weeks earlier than normal, and roadsides were almost universally brown by the first of July. The total hay crop of the area is estimated at 5,000,000 metric tons. In this connection, straw is widely used as a supplement to hay and the damage to the wheat crop has resulted in a reduction in the straw available from upland fields in Toscana, Campobasso and Calabria.

Fruits and Fresh Vegetables

Fruits were little damaged by the drought, and grapes are in good condition, having received reasonably adequate spray protection in this dry season. Deciduous fruits are of poor quality, except in specialized plantings, but the supply is adequate to meet all demands, especially ~~of~~. Citrus fruits are in need of additional protection from sooty insects, and are suffering from the shortage of nitrogen fertilizer, conditions which will necessitate further action in order to insure a good quality crop. The supply of fresh vegetables is adequate, since they are largely produced in irrigated areas, and must be consumed close to the producing areas.

Apulia and Sardinia

The severest drought damage has occurred in these two areas, owing to the "drought-susceptible" nature of the Apulian plateau and central and northern Sardinia, and to the prevalence of grasshoppers which can cause considerable damage in any dry year. Nevertheless, reports received from Sardinia have consistently exaggerated the situation, necessitating special efforts to obtain objective information. Since it has been established that comparable conditions exist in Apulia, the two areas will be considered together, although

785017

further surveys will be made in Sardinia in order to insure recognition of any change for the worse. Fertilizer deficiencies, inter-cropping, and unproductive areas are as described for the remainder of Central and Southern Italy.

Wheat and Barley

Wheat production from the area indicated is 43% below 1944, 45% below 1943, with an estimated average yield per hectare of 5 quintals in 1945. The reduction in yield is due to extreme drought conditions in Puglia, drought damage to the crop inter-spaced with olives in the remainder of Apulia, combined drought and locust damage to the low-producing provinces of Nuoro and Sardinia, and an estimated 20% drought damage to Osgliari, the major wheat producing area in Sardinia. Locusts did not invade the wheat fields of Cagliari province in time to appreciably damage the crop. However, spring rains were practically non-existent throughout the area, although cool weather decreased the damage in Sardinia. Poor prospects for rain, and a shortage of forage, resulted in grazing many fields rather than attempting to save the crop for threshing. The total production is estimated to be 305,015 metric tons, which is made up of 274,015 metric tons of wheat and 26,000 metric tons of barley.

Corn

The area produces very little corn, and the production this year was damaged by drought, but the damage is of little consequence in view of the fact that the average yield normally only totals 15,000 metric tons, and is therefore a minor factor in the diet of the area.

Rice, Sugar Beets, Hemp, and Flax

There is practically no commercial production of these crops in the area.

Legumes

The production of legumes is estimated to be 60% of 1944 (which was a low production year), and while the acreage planted to fava was 60% of normal, the crop was severely damaged by the lack of spring rains especially in the large producing areas of Puglia. The total production is estimated to have been 50,000 metric tons of fava and 15,000 metric tons of other legumes.

Hay including Alfalfa

The hay crop was very badly damaged by the lack of spring rains, and permanent pastures as well. However, grazing of wheat stubble has provided temporary relief. The situation may become critical after the stubble has been grazed for 4-6 weeks, and prior to the fall rains. However, by supplementing available stocks of hay, if possible, with imports from northern provinces, the difficulty in maintaining the cattle popu-

1280

785017

In Apulia, combined drought and locust damage to the low-producing provinces of Nuoro and Sassari, and an estimated 20% drought damage to Cagliari, the major wheat producing area in Sardinia. Locusts did not invade the wheat fields of Cagliari province in time to appreciably damage the crop. However, spring rains were practically non-existent throughout the area, although cool weather decreased the damage in Sardinia. Poor prospects for rain, and a shortage of forage, resulted in grazing many fields rather than attempting to save the crop for threshing. The total production is estimated to be 305,015 metric tons, which is up of 27,015 metric tons of wheat and 26,000 metric tons of barley.

Corn

The area produces very little corn, and the production this year was damaged by drought, but the damage is of little consequence in view of the fact that the average yield normally only totals 15,000 metric tons, and is therefore a minor factor in the diet of the area.

Rice, Sugar Beets, Hemp, and Egg.

There is practically no commercial production of these crops in the area.

Legumes

The production of legumes is estimated to be 50% of 1944 (which was a low production year), and while the acreage planted to fava was 60% of normal, the crop was severely damaged by the lack of spring rains especially in the large producing areas of Foglia. The total production is estimated to have been 50,000 metric tons of fava and 15,000 metric tons of other legumes.

Hay including Alfalfa

The hay crop was very badly damaged by the lack of spring rains, and permanent pastures as well. However, grazing of wheat stubble has provided temporary relief. The situation may become critical after the stubble has been grazed for 4-6 weeks, and prior to the fall rains. However, by supplementing available stocks of hay, if possible, with imports from northern provinces, the difficulty in maintaining the cattle population and the present population of sheep will be reduced. The total hay crop of the area is estimated at 500,000 tons, approximately 40% of normal. Straw is used as a supplement to hay, and the damage to the wheat crop has resulted in a 35% reduction in the straw available in Apulia, Nuoro and Sassari, but there was not as critical a reduction of straw in Cagliari.

Fruits and Fresh Vegetables

Fruits produced in this area were little damaged by the drought. Grapes are in especially good condition and the supply of grapes and figs will be adequate. The supply of fresh vegetables is adequate, since they are largely produced in irrigated areas, and must be consumed close to the producing areas.

APPENDIX 3

25

Italian Wheat Situation
15 July 1945

The total Italian wheat production is now estimated to be 4,188,589 metric tons, a reduction of 238,777 metric tons since the 15 June estimate was prepared. This estimate is 3% below the revised total of the 1944 wheat crop. The total acreage is estimated at 11,111,934 acres, an increase of 332,892 over the June estimate of 10,779,042, and only 6% less than the revised 1944 total of 11,848,167 acres. These changes in estimates do not represent changes in the crop situation, but rather the normal revisions in data during an intensive study of the situation, such as is now in progress, as the serious nature of the damage directs the attention of the estimators to the need for accuracy in the data. The estimated average yield per hectare is 9.3 quintals.

Further study of the legal retentions has increased the estimated total slightly, from 2,865,000 metric tons to 2,886,000 metric tons. This is due to the inclusion of persons returning to Italy and to the farms, and to the inclusion of retentions for additional categories of workers, in the Ministerial Decree applicable to Italian Government territory, which has been extended to Allied Military Government territory in order to insure equal treatment of all classes.

The net result is a reduction in the "arableable total" from 1,500,000 metric tons to 1,303,000 metric tons. The changes in data are summarized in the following table, and detailed tables 1 to 4, which supersede the data outlined in Appendices A to D of the report of 15 June:

Changes in the 1945 Italian Wheat Situation

	Crop Report Estimate 15 June	Crop Report Estimate 15 July	Difference
Area - North	3,208,290 acres	3,215,930 acres	+ 7,640
- Other	7,570,752 "	7,896,004 "	+ 325,252
Total Area	10,779,042 "	11,111,934 "	+ 332,892
Production - North	2,052,110 m.t.	1,910,221 m.t.	- 111,889
- Other	2,375,204 "	2,248,367 "	- 126,837
Total Production	4,427,314 "	4,186,588 "	- 238,726

Report on Wheat Crop Conditions in Sicily, Southern Italy, and Southern Italy

Production

All of the wheat was harvested, except certain fields in the mountainous areas, and late-maturing wheat. Approximately 4% had not been cut by 15 July. The quality of grain was very good, although about 25% is shriveled because of moisture deficiency - it did not fall properly. The quality is in sharp contrast to last year's crop, which was very shabby. Less than 2% of this crop is affected by smut.

O 7 5 2

Further study of the legal retentions has increased the estimated total slightly, from 2,865,000 metric tons to 2,986,000 metric tons. This is due to the inclusion of persons returning to Italy and to the farms, and to the inclusion of retentions for additional categories of workers, in the Ministerial Decree applicable to Italian Government territory, which has been extended to Allied Military Government territory in order to insure equal treatment of all classes.

The net result is a reduction in the "allowable total" from 1,500,000 metric tons to 1,303,000 metric tons. The changes in date are summarized in the following table, and detailed tables 1 to 4, which supersede the data outlined in Appendices A to D of the report of 15 June:

Changes in the 1945 Italian Wheat Situation

Report on Wheat Crop Conditions in Sicily, Sardinia, and Southern Italy

Production

All of the wheat was harvested, except certain fields in the mountainous areas, and late-maturing wheat. Approximately 4% had not been cut by 15 July. The quality of grain was very good, although about 25% is shriveled because of moisture deficiency - it did not fill properly. The quality is in sharp contrast to last year's crop, which was very watery. Less than 2% of this crop is affected by smut.

Threshing has been delayed in Sicily, partly due to lack of belting required and fuel, and also because of controversies about the division of the crop between landlord and tenant. Only 30% is normally threshed by machine, the remainder being threshed by hand, with scythes or with animals. These methods are less efficient, leaving grain in the straw. The cost of threshing has increased, with an average of approximately 200 lire per quintal. Harvest wages vary from 125 to 300 lire per day, plus food.

785017

PENDIX B - continuedCrop Statistics

The difficulties the Ispettorati Agrari and UNSEA officials encounter in trying to secure reliable and adequate data must be taken into consideration in evaluating the situation, under pressure as they are from the Government, the producers, and the political parties. Most of the officials, due to the lack of transportation, fear of personal safety and desire to placate the farmers, have spent very little time out in the drowndoes to secure information regarding the production. In some cases a zealous official making field surveys paid transportation out of his own pocket, as the budget set up for transportation costs up to 45 lire per Kilometer, plus gasoline, provides an excuse for the failure of officials to make field contacts. This situation will improve as and when action taken by the Ministry is successful in providing cars, tires, and fuel for this important work.

The extremely bad crop year, the fear of a general shortage of food, anticipated difficulties in amassing the crop, all these factors have combined to make the farmers and officials pessimistic in their production forecasts. The farmers and the town people are all eager to hold as much wheat as possible, as insurance against short rations, hence declarations of acreage and yield are as low as possible. The survey parties changed the estimated yield per hectare in some provinces, increasing the estimates of the Provincial Ispettorati, after discussion of these factors with the Compartimental Ispettorati.

Crop Collection

Declarations by farmers account for about 56% of the area sown to wheat in Italian Government territory, hence the returns to date are inadequate to determine the accuracy of the acreage estimates. Completion of the farms has been slow in all of the areas, especially so in Sicily, partly due to the delay in threshing the crop, but primarily due to the lack of aggressive supervision. The Communal Committees have not been particularly active, and changes in personnel have been made, but only the Provincial Committees have been adequately functioning well. The number of police assigned to the work has been inadequate to maintain roadblocks and movement control, and grain is moving in illegal channels at 2,000 to 4,000 lire per q.li.

Corrective Action Taken

The Government is acting to correct the situation, and has been especially successful in a press and radio campaign supported by all parties, urging the farmers to turn in their wheat, publishing the fact that the nation faces a critical situation with no assurance of imports to make up for the crop damage. This will materially aid in correcting the lax administration of the regulations, if the officials concerned are equipped and supported by police. The Ministry of Agriculture has organized a super-control with Compartimental supervisors to coordinate the work of UNSEA and the other agencies. They have obtained an allocation of 100,000 litres of fuel, and some tires, and are arranging for the temporary requisitioning of cars by the prefectures. It is likewise presenting to the Government their priority of need for performance. Assigned transportation, in the hope that reorganized captured officials will be made available. They have obtained the assurance that 400 Guardia di Finanza will be available.

provides an excuse for the failure of officials to make field contacts. This situation will improve as and when action taken by the Ministry is successful in providing cars, tires, and fuel for this important work.

The extremely bad crop year, the fear of a general shortage of food, anticipated difficulties in assessing the crop, all these factors have combined to make the farmers and officials pessimistic in their production forecasts. The farmers and the town people are all eager to hold as much wheat as possible, as insurance against short rations, hence declarations of acreage and yield are as low as possible. The survey parties charged the estimated yield per hectare in some provinces, increasing the estimates of the Provincial Ispettorati, after discussion of these factors with the Compartimental Ispettorati.

Crop Collection

Declarations by farmers account for about 56% of the area sown to wheat in Italian Government territory, hence the returns to date are inadequate to determine the accuracy of the acreage estimates. Completion of the farms has been slow in all of the area, especially so in Sicily, partly due to the delay in threshing the crop, but primarily due to the lack of aggressive supervision. The Compartimental Committees have not been particularly active, and changes in personnel have been made, but only the Provincial Committees have been reported to be functioning well. The number of police assigned to the work has been inadequate to maintain roedblocks and movement control, and grain is moving in illegal channels at 2,000 to 4,000 lire per q.li.

Corrective Action Taken

The Government is acting to correct the situation, and has been especially successful in a press and radio campaign supported by all parties, urging the farmers to turn in their wheat, publicising the fact that the nation faces a critical situation with no assurance of imports to make up for the crop damage. This will materially aid in correcting the lax administration of the regulations, if the officials concerned are equipped and supported by police. The Ministry of Agriculture has organized a "super-control" with Compartimental supervisors to coordinate the work of UNSEA and the other agencies. They have obtained an allocation of 400,000 litres of fuel, and some tires, and are arranging for the temporary requisitioning of cars by the prefects. The Ministry is likewise presenting to the Government their priority of need for performing ~~11~~¹⁸ missions. They have obtained the assurance that 488 Guardia Finanziaria and 400 Carabinieri will be assigned to the crop collection program to provide in part the regulatory measures that are required. Decrees are in revision and strengthened, and the UNSEA organization is now operating under a decree which has been extended to AMG territory, giving them a national organization with funds and full authority.

APPENDIX C

ITALIAN FORAGE SITUATION

26 July 1945

1. A forage inspection trip was made to investigate the emergency conditions which have been reported to exist throughout Italy, and to give the agricultural officials of Northern and Southern Italy an opportunity to compare conditions in the respective regions. With this background these representatives set down around a conference table and, based on the necessity of maintaining the national livestock economy, determined where "surpluses" exist and where such declared surpluses should be sent.

2. Summary of Forage Conditions

Abruzzi.--The situation in Abruzzo is typical of most of Southern Italy. Hay can be obtained from straw, but hay and oats are urgently needed for the maintenance of their dairy cattle and better breeding herds. Apulia has been offered some straw from Calabria if baling wire is made available.

Sardinia.--The situation in Sardinia is worse than it has been in years and is more critical than in Southern Italy. They can get by on straw, but hay and oats are needed for the maintenance of dairy cattle, horses and sheep for breeding. Broad beans and barley would be acceptable substitutes for oats.

Sicily.--Conditions in Sicily are reported to be the same as in Southern Italy.

Central Italy.--It is agreed that supplies of forage in Central Italy are adequate to maintain the livestock population. Any local surplus will be absorbed by adjoining provinces.

Liguria.--Conensus of opinion is that 12,000,000 quintals are needed to meet all requirements for the entire year for their present livestock population. However, Liguria stated that if the Army ceases the purchase of hay they will be willing to permit some export from Liguria even though it is badly needed in Emilia Region.

Liguria.--This is a deficit forage-producing area. At present Liguria consumes forage imported from Lombardie. They have a need for 225,000 quintals of hay and straw to carry the four provinces.

Piemonte.--The situation in Piemonte is not as that described in Liguria. In 1930 forage production was 31,000,000 quintals. The estimated production for 1945 is 13,000,000 quintals. In 1940 there were 4,000,000 quintals of live weight and with 2,700,000 live weight in 1945. There will be some surplus production of hay in Cuneo and other small localities, but it will be impossible to get by with that there is no moving livestock from one

containing the national livestock economy; determined where "surpluses" exist and where such declared surpluses should be sent.

2. Summary of Forage Conditions

Abruzzo.--The situation in Abruzzo is typical of most of Southern Italy. Hay can be gotten from available straw, but hay and oats are urgently needed for the maintenance of their dairy cattle and better breeding herds. Oats has been offered some straw from Calabria if baling wire is made available.

Sardinia.--The situation in Sardinia is worse than it has been in years and is more critical than in Southern Italy. They can get by on straw, but hay and oats are needed for the maintenance of dairy cattle, horses and sheep for good breeding. Broad beans and barley would be acceptable substitutes for oats.

Sicily.--Conditions in Sicily are reported to be the same as in Southern Italy.

Central Italy.--It is agreed that supplies of forage in Central Italy are adequate to maintain the livestock population. Any local surplus will be absorbed by adjoining provinces.

Emilia.--Consensus of opinion is that 12,000,000 quintals are needed to meet all requirements for the entire year for their present livestock population. However, Emilia stated that if the army ceases the purchase of hay they will be willing to permit some export from Emilia even though it is badly needed in Lazio Region.

Liguria.--This is a deficit forage-producing area. At present 1,200,000 is consumed forage imported from Lombardia. They have a need for 225,000 quintals of hay and straw to carry the four provinces.

Piemonte.--The situation in Piemonte is much as that described in Emilia. In 1930 forage production was 21,000,000 quintals. The estimated production for 1931 is 13,000,000 quintals. In 1931 there were 4,000,000 quintals of hay which is compared with 2,700,000 live weight in 1930. There will be some surplus production of hay in Cuneo and other small localities. It will be possible to get by with what there is by moving livestock from one place to another. Small quantities of hay could be found for export from Cuneo Province but in general they will have to get by, without getting anything beyond the boundaries of Piemonte.

Lombardia.--For the last winter should be viewed in terms of (1) southern areas (2) dry cultivation areas, and (3) irrigated areas. Lombardia could help national situation but must take into late consideration that grazing in the mountains will end 10 to 15 days earlier than normally, and in this instance forage will have to be imported into the valleys to

785C17

meatless livestock. Production in the dry-cultivation areas has been reduced about 60% depending upon depth of soil, and 25% in areas where trees are already buying hay. The prices range from 1200 to 2000 lire per quintal. In the irrigated areas green feed is used for 10 of the 12 months, depending on dry hay for only 2 months of the year. Estimated production in irrigated areas shows 20% reduction in 1945. The normal hay production is 32 million quintals for 1,500,000 head of cattle. In 1945 a hay production of 20-25 million quintals is estimated for 1,200,000 head of cattle. Below the Po and in some of the mountain areas there is a definite shortage. There has normally been some export of hay from Lombardia, especially from Brescia to other regions and to Switzerland. The reduction in the 1945 straw production is estimated at 40%. Any procurement would have to be compulsory.

Venezia—(Exclusive of Venezia Giulia) The condition of the mountain pastures is similar to that described in Piemonte and Lombardia where cattle will have to come down from the mountains several weeks earlier. The first out of hay on the plains was light, as is the second crop. If it rains in August it will make a great difference and such rains would adequately provide for winter requirements and 4,000 tons that could be exported. Without rain in August however, the situation will be extremely critical. The normal production of hayage is given as 42,000,000 quintals compared with an estimated production in 1945 of 25,200,000 quintals. The normal population of bovines is given as 1,500,000 and it was stated that livestock census is presently being taken. Present estimates are 1,300,000. Straw production in 1945 was approximately half of normal. It was also pointed out that if protein to supplement the forage could be provided, it would raise the possibility of procuring surpluses, that may result with the rains, a much easier job.

3. Exportable quantity Available

All exportable "surpluses" declared at this meeting were based on the premise that the Army would cease purchasing hay in these areas. All quantities herein indicated do not represent actual surpluses in the respective regions, but rather the amounts that the regions are willing to declare exportable in order to help maintain dairy and breeding herds in Southern Italy and Sicily. A feeling of willingness to help the needy areas of the country is freely expressed.

On this basis the following exportable surpluses have been declared:

			100 tons of oats	
Battaglia	5,000	tons of hay	"	
Piemonte	2,000	"	"	600
Lombardia	2,300	"	"	"
Venezia	4,000	"	"	"
				—
	13,300	"	"	1,300

4. Demands for Hay and Oats.

Sicily, even though deficit, will be able to take care of its own needs little to nothing to meet food grain needs.

Venezia - (Exclusive of Venezia Giulia) The condition of the mountaineer's pasture is similar to that described in Piemonte and Lombardia where cattle will have to come down from the mountains several weeks earlier. The first out of hay on the plains was light, as is the second crop. If it rains in August it will make a great difference and such rains would adequately provide for winter requirements and 4,000 tons that could be exported. Without rain in August however, the situation will be extremely critical. The normal production of forage is given as 42,000,000 quintals compared with an estimated production in 1945 of 23,200,000 quintals. The normal population of bovines is given as 1,500,000 and it was stated that the livestock census is presently being taken. Present estimates are 1,300,000. Straw production in 1945 was approximately half of normal. It was also pointed out that if protein to supplement the forage could be provided, it would make the possibility of procuring surpluses, that may result with the rains, a much easier job.

3. Exportable Quantity Available

All exportable "surpluses" declared at this meeting were based on the premise that the Army would cease purchasing hay in these areas. All quantities herein indicated do not represent actual surpluses in the respective regions, but rather the amounts that the regions are willing to declare exportable in order to help maintain dairy and breeding herds in Southern Italy and Sardinia. A feeling of willingness to help the needy areas of the country is freely expressed.

On this basis the following exportable surpluses have been declared:

Mille	5,000 tons of hay	100 tons of oats	1271
Piemonte	2,000 " "	600 " "	
Lombardia	2,500 " "	-	
Tenozia	4,000 " "	-	
		—	
	15,500 " "	300 " "	

4. Demands for Hay and Oats

Sicily, even though deficit, will be able to take care of its own needs. Liguria's need is for draft horses, and very little to maintain good dairy and breeding herds. Declared surpluses are to be distributed in Southern Italy and Sardinia, and not Liguria.

On this basis the following needs were determined:

Agrilia	15,000 tons of hay	20,000 tons of oats
Sardinia	5,000 " "	9,300 " "
Liguria	2,000 " "	12,500 " "
	31,700 tons of hay and straw	800 " "
		42,600

785017

5. Prices

Sardinia has expressed willingness to pay up to 1500 lire per quintal for hay for deliveries made to the port of Cagliari. Apulia has stated that they would pay 1500 lire per quintal or even go as high as 1800 for hay delivered at ports or stations in Apulia. These statements immediately brought out the point that many producers are already getting twice prices or higher.

6. Method of Procurement

The Istitutorati of the Northern Regions definitely stated that the only way surpluses could be amassed would be to (1) pay a very attractive price and it was agreed that this price would have to be higher than the necessary consumers could possibly pay, or (2) that a very rigid emassing order backed by armed force would be necessary. It would not be possible to get available quantities amassed by a patriotic appeal based on the needs of all Italy and the importance of maintaining at least a skeleton livestock economy in Southern Italy and Sardinia.

30 June 1945

JUL 2 1945

My dear Mr. Prime Minister:

The Economic Section has forwarded for my attention a report which indicates that the production of wheat is expected to be approximately 2 million tons less than last year, due to widespread drought conditions which have, in turn, accentuated the fertilizer deficiency. It is evident that the maintenance of an adequate diet will be considerably more difficult than during the past season.

The loss of 2 million tons of grain reduces the food supply, and at the same time reduces the financial resources of the nation. Thus, agriculture can no longer be expected to absorb labor surpluses, and even the problem of disposal of refugees may become difficult. Furthermore, the matter is of increased importance from the standpoint of public safety and public health, for food shortages may be expected in rural areas where subsistence farms have not produced enough for the needs of their owners. Illegal disposition of grain and actual food shortages may be expected to occur over a much greater area.

Since broad economic and administrative problems can be anticipated, it is recommended that the matter be presented for consideration by the Council of Ministers, as a problem warranting fullest support of the special programs that the Ministries of Agriculture and Food will be developing in order to most accurately define the size of the crop that is being harvested, and to insure the fullest availability for distribution during the coming season. Also, the interested Ministries should be in a position to take action appropriate to the problems which may be expected in finance, labor, public health, public safety, etc.

Yours very truly,

ELLIOT W. STONE
Near Admiral, USNR
Chief Commissioner

ECONOMIC SECTION

AGR/81C

25 June 1945

SUBJECT: Current Italian Wheat Crop Estimate

TO : Chief Commissioner

(b)

1. Transmitted herewith is a copy of a report on the current Italian wheat crop, together with information contained in a signal which was forwarded to AFHQ, G-5 Section, for onward transmission to London and Washington in reply to their inquiry in that regard.

2. The report indicates that the production of wheat is expected to be approximately 2 million tons less than last year, due to widespread drought conditions which have, in turn, accentuated the fertilizer deficiency. While the exact extent of the reduction will be more accurately defined at threshing time, it is evident that the maintenance of an adequate diet will be considerably more difficult than during the past season.

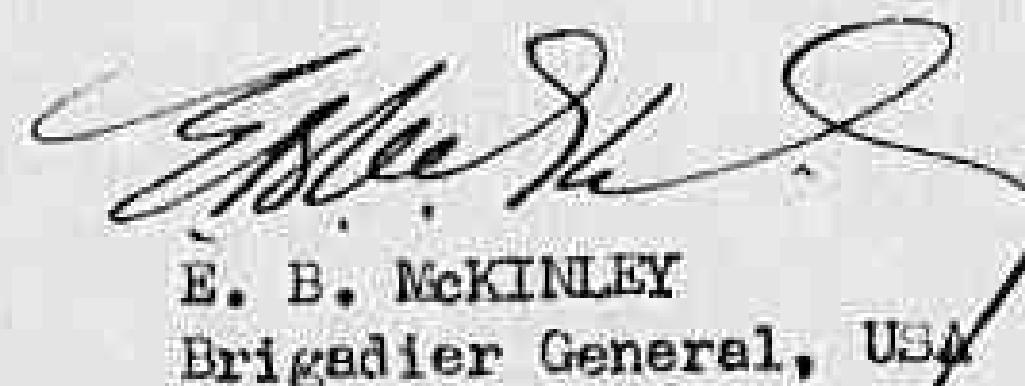

3. The damage to the wheat crop is such as to introduce economic problems of considerable importance. The loss of 2 million tons of grain reduces the food supply, and at the same time reduces the financial resources of the nation by approximately 220 million dollars. Thus, the income of the 47% of the people in Italy dependent upon agriculture is reduced to a point where agriculture can no longer be expected to absorb labor surpluses, and even the problem of disposal of refugees may become difficult. Furthermore, the matter is of increased importance from the standpoint of public safety and public health, for food shortages may be expected in rural areas where subsistence farms have not produced enough for the needs of their owners. Illegal disposition of grain and actual food shortages may be expected to occur over a much greater area.

4. The estimate of the available wheat supply cannot be finalized until the crop has been threshed, for actual threshing records are necessary to establish the exact extent of the reduction. The attention of the Ministry of Agriculture, and of the Agricultural Officers in the field, is currently being directed to the great importance of accuracy in this regard. However, since broader economic and administrative problems can be anticipated, it is recommended that the matter be brought to the attention of Civil Affairs Section and the Regional Commissioners for such action as may be appropriate.

1263-14

AGRICULTURE SUB-COMMISSION

1945 ITALIAN WHEAT CROP ESTIMATE
15 June 1945

This report is based upon data supplied by the Ministry of Agriculture field organization, acting in AIG territory under the supervision of the All-Regional Agricultural Officers, and supplemented by observations made by Allied survey parties in Central and Southern Italy and Sicily during the first ten days of June 1945. The crop was estimated at 4,427,000 metric tons, as compared with 6,390,661 metric tons last season, and a ten-year average of 7,103,000 metric tons. The acreage planted to wheat was estimated at 10,783,799 acres, compared with 11,769,770 planted last year, and a ten-year average of 12,572,300 acres.

The wheat crop was at that time in various stages of maturity and harvest. In a very few areas threshers and combines were operating. It was observed that the grain threshed was often a little smaller in size than under normal crop conditions. Over half of the crop was yet to be cut, and in the mountainous regions the majority of the wheat was still immature. The variety Frossineto, which is very important in Marche, Abruzzi and Molise, and of less importance in Puglia and Lucania, was still green and in the stage of filling. In general, the crop was said to be about 15 days late in maturity this year. Factors contributing to this lateness are (1) lack of spring rains which retarded growth, (2) late seeding of the crop in some areas, and (3) lack of phosphate fertilizer which always hastens maturity.

Drought

One factor estimated to be responsible for at least 70% of the 1945 wheat crop reduction has been the lack of moisture. The lack of moisture was most apparent in areas where the soil is rocky and shallow, including southern mountainous areas and rather large areas of the flat plains in Southern Puglia, but was also evident in fields where wheat is grown among trees. Therefore, the greatest reduction, from drought damage, was so serious in some of the wheat production land. Drought conditions were so persistent that it is doubtful if the producers will get their back. The mainland provinces of Calabria and Cosenza,

The small marginal farms, generally speaking, suffered more from drought than did the large wheat surplus-producing farms. On irrigated or valley land which is rich and holds moisture, and land which was summer

Field organization, acting in AMG territory under the supervision of the AMG Regional Agricultural Officers, and supplemented by observations made by AL- lied survey parties in Central and Southern Italy and Sicily during the first ten days of June 1945. The crop was estimated at 4,427,000 metric tons, as compared with 6,390,661 metric tons last season, and a ten-year average of 7,103,000 metric tons. The acreage planted to wheat was estimated at 10,783,799 acres, compared with 11,769,770 planted last year, and a ten-year average of 12,572,300 acres.

The wheat crop was at that time in various stages of maturity and harvest. In a very few areas threshers and combines were operating. It was observed that the grain threshed was often a little smaller in size than under normal crop conditions. Over half of the crop was yet to be cut, and in the mountainous regions the majority of the wheat was still immature. The variety Frossineto, which is very important in Marche, Abruzzi and Molise, and of less importance in Puglia and Lucania, was still green and in the stage of filling. In general, the crop was said to be about 15 days late in maturity this year. Factors contributing to this lateness are (1) lack of spring rains which retarded growth, (2) late seeding of the crop in some areas, and (3) lack of phosphate fertilizer which always hastens maturity.

Drought

One factor estimated to be responsible for at least 70% of the 1945 wheat crop reduction has been the lack of moisture. The lack of moisture was most apparent in areas where the soil is rocky and shallow, including southern mountainous areas and rather large areas of the flat plains in Southern Puglia, but was also evident in fields where there is growth among trees. Therefore, the greatest reduction, from drought damage, is in the areas of marginal type wheat production land. Drought conditions were so serious in some of the hardest hit areas that farmers chose to pasture their wheat, and in other fields it is doubtful if the producers will get their seed back. The mainland provinces most seriously affected by the drought were Lecce, Brindisi, Lari, Taranto and Cosenza.

The small marginal farms, generally speaking, suffered more from drought than the large wheat surplus-producing farms, on irrigated or valley land, which is rich and absorbs and holds moisture, and land which was summer fallowed last season, a normal production was expected. Estimates of from 20 to 30 quintals per hectare were very common on these good lands. The notable exception is the Foggia area, where the large farms are very badly damaged.

Comparative Rainfall Data - March, April, May 1945

Locality	Average	1945 Season		Reduction in Rainfall	
		m/m	%	m/m	%
Ligurian Area	411.9	52.5	49.9	49	40
Abruzzo & Molise Region	256.6	150.6	103.8	75	40
Bari	227.2	57.7	169.5	64	75
Campania	137.7	50.1	87.6	77	71
Calabria	224.9	51.4	173.8	71	71
Chieti-	242.7	70.6	172.1	71	71
Foggia	241.8	69.4	172.4	71	71
Firenze	224.7	73.9	146.4	65	65
Roma	216.3	46.9	169.4	78	78
Taranto	114.9	17.4	96.9	85	85
Emilia Region	217.5	112.8	104.7	48	48

Fertilizer Deficiency

Shortage of fertilizer is estimated to have caused up to 18% of the total crop reduction. The shortage of fertilizer during the past several years materially reduced seeding in some areas because of the accumulated infertile soils which had adequate moisture would have made larger yields had fertilizer been present to hasten maturity and increase yield. Phosphate fertilizer tends to hasten maturity and produce plumper kernels. Anything which would have hastened the maturity of this year's crop would have minimized drought damage. The shortage of phosphate fertilizer was a greater factor in reduced yields than nitrate, for nitrate, tending to increase plant growth and stimulate stooling, was of little value under this year's drought conditions. However, the lack of nitrate was a contributing factor in the reduction in acreage planted.

Other Adverse Factors

Late seeding, frosts, flooding and hot winds are further causes in the reduction of this year's wheat crop. In some areas of Piemont and Abruzzi, frost damage was reported in the early part of May. The crop, late planted because of deficiencies in draft power, equipment, bad weather, etc., failed to stand as steadily as an early sown crop, and was maturing later in the season, and irregularly. The prevalence of hot winds, severe in the extreme southeastern portion but extending up through the southern provinces, has also increased premature ripening of grain. In addition, certain areas in Emilia and Lazio were planted late or remained unplanted due to flooding or damaged

Fertilizer Deficiency

Shortage of fertilizer is estimated to have caused up to 18% of the total crop reduction. The shortage of fertilizer during the past several years materially reduced seeding in some areas because of the accumulated in-fertility.

Other lands which had adequate moisture would have made larger yields had fertilizer been present to hasten maturity and increase yield. Phosphate fertilizer tends to hasten maturity of this year's crop would have minimized drought damage. The shortage of phosphate fertilizer was a greater factor in reduced yields than nitrate, for nitrate, tending to increase plant growth and stimulate stooling, was of little value under this year's drought conditions. However, the lack of nitrate was a contributing factor in the reduction in acreage planted.

Other Adverse Factors

1263

Late seeding, frosts, flooding and wet winds are further causes in the reduction of this year's wheat crop. In some areas of Piemont, and Abruzzi, frost damage was reported in the early part of May. The crop, late planted because of deficiencies in draft power, equipment, bad weather, etc., failed to stool as evenly as an early seeded crop, and is maturing later in the season, and irregularly. The prevalence of hot winds, severe in the extreme southern portion but extending up through the southern provinces, has also increased premature ripening of grain. In addition, certain areas in Emilia and Lazio were planted late or remained unplanted due to flooding of damaged land situations areas.

Crop Reporting System - Validity of Data

In the initial consideration of these data, three factors have indicated the necessity for further action in order to accurately define the present crop reduction. The final yield per acre, the weather through 1 July, and the accuracy of the reporting organizations are phases which warrant further consideration in view of the gravity of the situation. The drought affected such a large area that the estimated yield per acre has been revised downward everywhere. It is customary in Italy to finalize such estimates during the threshing operations when quantitative figures are available. These data are essential to a realistic yield estimate this season because

785 C 17

of the importance of small differences then applied to the large areas involved.

As has been indicated, the grain crop is maturing irregularly statewide. Particularly in mountainous areas and in northern areas, there is a sufficient portion of the crop as yet not "filled" to materially affect the total crop, if the month of June proves to be exceptionally favorable or unfavorable.

The third factor - that of the crop-reporting organization - is relevant mainly because the shortage of transportation and communication now at the disposal of the Italian officials prevents their making the usual detailed observations necessary to accurately establish the yield per acre during the critical weeks before harvest. In addition, the organization is handicapped by the loss of a certain proportion of its key numbers, relocation of others, etc., all of which makes the crop estimates less firm. Finally, the probability of a certain amount of pessimism in crop reporting, even by trained technicians, cannot be disregarded. The importance attributed to the production of wheat in Italy, and the seriousness of a shortage, are factors with which these crop estimators are all too familiar.

Resultant Action

In view of the reliance necessarily to be placed on the threshing and yield per acre, such data will be obtained in the fullest possible detail, throughout the threshing period. All practicable verification of the data will be accomplished, by comparison with historical records and supplemental field investigation.

Appendices

Detailed tabular information is attached, as follows:

- I - Estimated Yield, by Compartments
- II - Estimated acreage, by Compartments
- III - Estimated Yield, by Provinces
- IV - Estimated acreage, by Provinces
- V - Estimated Net Production after Retentions

785017

Italian Wheat Situation

a.	Estimated Whee. Acreage	10,783,799 acres
b.	Estimated Wheat Yield	2,052,000 north 2,375,000 south (including Islands)
c.	Estimated Assessing Target	4,427,000 metric tons
d.	All Estimates Concurred in by Ministry of Agriculture	1,500,000 "
e.	Estimated Legal Retentions (same as in 1942-43)	2,865,000 "
f.	Actual Retentions in 1942-43	3,695,000 "
g.	Expected Actual Retentions in 1945	3,286,000 "
h.	Net Available after Legal Retentions	1,017,000 north 545,000 south (including Islands) 1,562,000 "

Acreage reduction since last season 8% due largely to retirement from production of mountainous marginal and inter-planted grove areas and accumulated fertilizer shortage, but also reduced by flooding in Po Valley areas and general shortage of farming equipment.

Estimated yield sharply reduced due to reduced yield per acre because of widespread drought conditions prevailing which are reported worst since 1922, largely without relief since March, aggravated by fertilizer deficiencies which delayed maturing.

Estimated total amassable wheat is reduced by drought conditions in important producing areas, such as Foggia, but damage to high-producing plains areas is generally less than that to small holdings especially in mountainous areas, hence the amassable total is affected only in part with proportionately greater reduction to the amount available to small farmers who normally contribute little or nothing to the Amassi.

125

The above information was forwarded to AFHQ, G-5 Section, in signal 274 of 21 June 1945, for onward transmission to TROOPERS and AGWAR in reply to their PAT 100 of 2 June.

Ministry of Agriculture

e.	Estimated Legal Retentions (same as in 1942-43)	2,865,000
f.	Actual Retentions in 1942-43	3,695,000
g.	Expected Actual Retentions in 1945	3,286,000
h.	Net Available after Legal Retentions	1,017,000 north <u>545,000</u> south (including Islands)
		1,562,000

Acreage reduction since last season 8% due largely to retirement from production of mountainous marginal and inter-planted grove areas and accumulated fertilizer shortage, but also reduced by flooding in Po Valley areas and general shortage of farming equipment.

Estimated yield sharply reduced due to reduced yield per acre because of widespread drought conditions prevailing which are reported worst since 1922, largely without relief since March, aggravated by fertilizer deficiencies which delayed maturing.
