Declassified E.O. 12356 Section 3.3/NND No. 785020

Subject:- Italian Disabled Soldiers.

Land Forces Sub-Commission A.C.
(M.M.I.A.) ROME

A 029

27 Dec. 45

To :-- Chief Commissioner A.C.

With reference to your letter dated 7 Dec. 45 and attached correspondence on the subject of taking care of Italian disabled soldiers.

The matter has been discussed with the Ministry of War and it has been agreed that it is not possible to find the 2,000 to 3,000 men required for this duty out of the present small Italian Army ceiling.

The solution which has been suggested is that the War Ministry ask the Italian Government to get the Italian Red Cross to make themselves responsible for this service.

HEADQUARTERS ALLIED COMMISSION

Office of the Chief Commissioner
APO 394

R.A.

7 December 1945.

MEMORANDUM TO: Director, Land Forces Sub-Commission.

With reference to the attached, will you let me know your decision in this matter before you take final action. If there is any way we can comply with the wishes of the Italian Government in this respect, I should like to do so.

E.W.

ELLERY W. STONE
Rear Admiral, USNR
Chief Commissioner

Spoke LOMBARDI 20 Dec

It was agreed:

1. That it was desirable from every point of view that the Army should be rid of this obligation (this in confidence);
2. That it was impossible to find the 2-3,000 men required out of the present Army ^{existing} ~~existing~~ ^{to the Govt.} Italian Red Cross be
- ③. That our Ministry would suggest that Italian Red Cross be more responsible for this service. ^{to the Govt.} ~~Chairwoman~~ was.

O Land Forces S/C 355

G.

96

Rome, 27 November, 1945

My dear Admiral,

as you well know, disabled and blind soldiers were formerly given by the War Department, soldiers that practically always belonged to the Sanitary Corps, as escort.

However, the Allied Sub-Commission in charge of such matters, considering that such a service is not part of the special tasks of the Armed Forces, withdrew the acknowledgement of their status granted to the soldiers entrusted with such service, who therefore don't get the pay fixed for the Armed Forces.

Understanding the absolute necessity of granting proper assistance to this category of disabled soldiers, the Italian Government tried to entrust this task to civilian elements, but, unfortunately, it met with great difficulties.

In fact, the relatives of the disabled soldiers, when it is possible to ask for their service, are generally unfit for assistance, particularly in cases when the disabled soldiers cannot do anything for themselves without help.

On the other hand, it is still more difficult to find adequate foreign elements, and we have well founded doubts as to whether such people would conscientiously carry out the mission to be entrusted to them.

Because of the obstacles which I mentioned, I beg you to consider with your usual comprehension, the possibility of asking the Sub-Commission concerned to reconsider the decision that has been taken.

I feel sure you will grant my request, and I remain, my dear Admiral,

Sincerely yours,

s. Ferruccio Parri

Roma, 27 NOV. 1945

Il Presidente
del Consiglio dei Ministri

Caro Ammiraglio,

come Le è noto, ai grandi invalidi ed ai ciechi di guerra sono stati assegnati per il passato, dal Ministero della Guerra, in qualità di accompagnatori, dei militari, appartenenti, quasi sempre al Corpo sanitario.

Senonche, la competente Sottocommissione Alleata, nella convinzione che tale servizio di assistenza non rientri nelle specifiche mansioni delle Forze Armate, ha ritirato ai militari, preposti a tale assistenza, la concessione del riconoscimento del loro status e, di conseguenza, la corresponsione del trattamento stabilito per le Forze Armate.

Il Governo italiano, compreso della assoluta necessità di concedere un'adeguata assistenza a tale categoria di minorati, ha tentato di affidarne il compito ad elementi civili, ma, purtroppo, ha incontrato le più gravi difficoltà.

Infatti, i congiunti degli invalidi, nei casi in cui può farsi ricorso alla loro prestazione, si dimostrano in genere inadatti all'assistenza, specialmente se la mutilazione non

consente ai minorati di adempiere da soli alle loro più intime esigenze.

D'altra parte, si riscontrano le maggiori difficoltà nella ricerca di elementi estranei idonei e, del resto, sono da affacciarsi i più fondati dubbi sullo scrupoloso adempimento, da parte di tali persone, della missione che loro si vorrebbe affidare.

In considerazione degli ostacoli, di cui Le ho fatto cenno, La prego vivamente di voler considerare, con la sperimentata Sua comprensione, la possibilità di invitare la competente Sottocommissione a riesaminare la determinazione adottata.

Nella convinzione che la mia preghiera trovi favorevole accoglimento, La prego di gradire, caro Ammiraglio, i miei più cordiali saluti

Ferruccio Rami

Subject:- Army Medical Publications

1. The Army Medical Journal ceased to be published in June 1943. A resumption of its publication is under consideration and it is believed that this can be accomplished in 2 - 4 months.
2. A substantial amount of material has already been collected for the first few numbers of the "Journal".
3. A news bulletin for territorial and field medical units was published during the war of 1915 - 18. It was later replaced in substance by the Army Medical Journal (reviews, therapeutical novelties etc.)
4. It is, nevertheless, believed to be strongly advisable to resume the publication of a bulletin of an essentially informative and practical nature, as a supplement of the Army Medical Journal, to be distributed to all the technical personnel of the Medical Service.
5. It would be very gratifying and certainly very profitable to be able to draw upon the information published in the Bulletins of the Medical Corps of the Allied Armies, when preparing our "Bulletin". Such (Allied) publications might be sifted for information to be used for the Italian Bulletin selecting the articles best suited for our medical officers mentioning, of course, the source. All this, to be sure, would be subject to prior authorisation by the allied authorities concerned.
6. This Directorate is this day contacting the Cabinet in order to obtain authorisation to resume publication of the Journal. Copies of same will be transmitted to you regularly as soon as published. We are, meanwhile, enclosing the last number of the Army Medical Journal - No. 6 of June 1943.

Subject:- Anti-Malaria Campaign - Hygienic - Preventive Discipline Small Scale Sanitation.

With the onset of the malarial period it is necessary for all units, and especially those in malarial areas to initiate as soon as possible, the preventive measures best adapted to oppose and fight the spreading of the disease. The ~~abandonment~~ and destruction almost everywhere, of the large scale anti-malarial works, completed or being completed, the defaging of the soil owing to the war, which is frequent in the liberated areas of Italy, the lack of, or inefficient work to improve the ground by the "small local anti-malarial measures" in the upkeep of the mechanical means of defence, have largely contributed to the re-forming of many numbers of malarial focal points (previously decreasing) and the increase of others, this being ascertained by the high percentage of cases of primary malaria in the last three years.

Consideration of such facts and experience gained during the last campaign, confirm the necessity of the decisive and direct intervention by all the Commands, intended to help and complete the work carried out by the medical units, not only for the safety of personnel health, but for the physical efficiency of the troops, but, also to limit as much as possible, the creation of new malarial focal areas in our land.

So as to obtain the best results from the whole of the means employed in the anti-malarial campaign, it is necessary that a constant and strict hygienic and preventive discipline will be enforced and thus the co-operation and determined participation by all officers, so that the problem is not only faced in all its aspects, but also with tenacity and firmness and with the full understanding of the necessity to carry it out.

The utility of the training courses, taking place during the pre-epidemic period by some Territorial Medical Directories for officers of the ~~armies~~, is well shown by the results obtained in the most heavily stricken areas. The officers who have attended have been active in spreading propaganda amongst the troops, of the necessity of the continuous, ~~continuous~~, ~~continuous~~ and

Declassified E.O. 12356 Section 3.3/NND No. 785020

Subject: - Anti-Malaria Campaign - Hygienic - Preventive Discipline Small Scale Sanitation.

With the onset of the malarial period it is necessary for all units, and especially those in malarial areas to initiate as soon as possible, the preventive measures best adapted to oppose and fight the spreading of the disease.

The abandonment and destruction almost everywhere, of the large scale anti-malarial works, completed or being completed, the defacing of the soil owing to the war, which is frequent in the liberated areas of Italy, the lack of, or insufficient work to improve the ground by the "small local anti-malarial measures" the posting of large units and civilians from one place to another, the carelessness in the upkeep of the mechanical means of defence, have largely contributed to the re-forming of many numbers of malaria focal points (previously decreasing) and the increase of others, this being ascertained by the high percentage of cases of primary malaria in the last three years.

Consideration of such facts and experience gained during the last campaign, confirm the necessity of the decisive and direct intervention by all the Commands, intended to help and complete the work carried out by the medical units, not only for the safety of personal health, but for the physical efficiency of the troops, but, also to limit as much as possible, the creation of new malarial focal areas in our land.

So as to obtain the best results from the whole of the means employed in the anti-malarial campaign, it is necessary that a constant and strict hygienic and preventive discipline will be enforced and thus the co-operation and determined participation by all officers, so that the problem is not only faced in all its aspects, but also with tenacity and firmness and with the full understanding of the necessity to carry it out.

The utility of the training courses, taking place during the pre-epidemic period by some Territorial Medical Directorates for officers of the ~~High~~ ^{High} Schools, is well shown by the results obtained in the most heavily stricken areas. The officers who have attended have been active in spreading propaganda amongst the troops, of the necessity of the continuous observation and scrupulously actualisation to carry out the various preventive measures.

We therefore affirm that, the Directorates will hold short anti-malarial courses of a purely practical and demonstrative character, for officers and N.C.O.s. of the services on the application of anti-malarial control measures.

The Medical Directorate General have started to collect the data needed for census of troops having malaria, either primary or recurrent, which have been shown as relapses during the last four years, with the intention to make them undergo during the month of April (pre-epidemic phase) their improved anti-malarial treatment. In order to carry this out the first particular instructions have been issued according to the availability of chemical means.

*****/2

Declassified E.O. 12356 Section 3.3/NND No. 785020

Sheet 2

Besides the above mentioned treatment and the successive preventive measures to be taken by troops in malarial areas as regard to which rules and regulations will also be issued), we impress on everybody the necessity to carry out local unit measures of clearance of ground and rivers which constitute a fundamental collaboration from all the Commands.
It is necessary:-

1. To ascertain by ground reconnaissance (by Hygiene Officer) in each of the localities where troops are billeted, the malarial areas and the grade of endemic malaria, making topo-malarial charts of malarious areas (a copy of which is to be sent to the Military Medical General Directorate), and the necessary contacts will be made with the local civilian authorities.
2. To formulate in relation to the above mentioned investigations on a concrete plan in which the following measures will be studied.
 - a) Ground amelioration and drainage.
 - b) Checking and re-organisation by all the available means, the prophylaxis (collective and individual).
 - c) Returns to this Ministry (Directorate General Medical Services) showing the requirements for the anti-larval campaign (anti-larvae - anti-mosquitos).
 - a) Instruction of unit squads to be employed on ground amelioration. These squads organically formed in each unit and well chosen will have to be put through a rapid and practical training period by the Regional medical Directorate, who will employ for this purpose the qualified medical officer having a good knowledge of the malaria problem. The small scale ground amelioration, if carried out correctly, and accurately, in the pre-epidemic period will obtain good results. It is well to bear in mind that any collection of water, clear or not, static or running, when there is vegetation or other means of obstructing the current will provide a breeding ground for mosquitoes. The small pools, the swamps, the brooks, the vegetation on the edges of the streams, and of the large or small vegetation canals, are all breeding places for the Anopheline larvae. Lakes, rice-fields, drains, drinking troughs, water tanks, artificial and natural irrigation basins etc., can all be potent breeding areas.
 - b) Filling depressions of grounds.
 - c) Draining of static water.
 - d) Control, cleaning and supervision of all collections of water within a radius of three Kilometres around buildings or camps.
 - e) Use whenever possible of larvae-eating fishes, control and maintenance of mechanical means for malaria control campaign.

I am certain that, for the approaching malaria campaign, the Medical Directorates will not lack moral and practical collaboration from all the Commands and only thus will it be possible to obtain a good preventive discipline with favourable results.

- (collective and individual).
c) Returns to this Ministry (Directorate General Medical Services) showing the requirements for the anti-malarial campaign (anti-larvae - anti-mosquitos - chemical prophylaxis therapy).

Instruction of unit squads to be employed on ground amelioration. These squads organically formed in each unit and well chosen will have to be put through a rapid and practical training period by the Regional Medical Directorate, who will employ for this purpose the qualified medical officer having a good knowledge of the malaria problem. The small scale ground amelioration, if carried out correctly, and accurately, in the pre-epidemic period will obtain good results. It is well to bear in mind that any collection of water, clear or not, static or running, when there is vegetation or other means of obstructing the current will provide a breeding ground for mosquitoes.

The small pools, the swamps, the brooks, the vegetation on the edges of the streams, and of the large or small vegetation canals, are all breeding places for the Anopheline larvae. Lagoons, rice-fields, drains, drinking troughs, water tanks, artificial and natural irrigation basins etc., can all be potent breeding areas.

The malaria squads will be trained therefore in the following work:-

- a) Filling depression of grounds.
- b) Drainage of static water.
- c) Control, clearing and supervision of all collections of water within a radius of three Kilometres around buildings or camps.
- d) Laying of Malaria and Paris Green and other anti-larvare material.
- e) Use wherever possible of larve-eating fishes, control and maintenance of mechanical means for malaria control campaign.

I am certain that, for the approaching malaria campaign, the Medical Directorates will not lack moral and practical collaboration from all the Commands and only thus will it be possible to obtain a good preventive discipline with favourable results.

Subject:- Anti-Malaria Campaign for 1945

By means of the printed circular No. 4/552/I.S. of February 22nd 1945, this Ministry, in view of the recurrence of the malarial epidemic season, has called the attention of all Commands to the necessity of enacting promptly the most effective preventive measures - especially in the case of units stationed in areas of endemic malaria - in order to retard and fight the spread of the infection. Assurances received so far from the various Regional Medical Directorates promise an early start of local soil drainage work and extermination of larvae and constitute proof of active co-operation between the Commands and Medical authorities for proper compliance with all necessary preventive measures.

During the pre-epidemic phase which may be regarded as ending on April 30th organised at each unit for soil, drainage work and intensify all land reclamation activities, but will also prepare malarial maps of the respective areas and establish the necessary contacts with civilian medical authorities to ensure that the work of controlling malaria will be conducted with unity of purpose and in active collaboration with the authorities concerned.

In pursuance of the above mentioned circular we wish to point out that, similar to the instructions issued last year, soldier with a previous malarial history will not receive the pre-epidemic course of treatment during April 1st to 30th. Instead, every medical officer ~~will~~ ^{is} give special attention to last year's primary cases of malaria and to chronic sufferers in order to be able to forestall any relapses in due time so as to assure, in every case, the most complete and scientific medical treatment.

Of great help in achieving this will be the census of malarial cases ordered by this Directorate and already performed almost everywhere. Bearing in mind that every case of malaria which is thoroughly cured is a centre of infection less, one should ensure that the treatment be always effective and thorough, and that it be always carefully followed up.

Subject:- Anti-Malaria Campaign for 1945

By means of the printed circular No. 4/552/I.S. of February 22nd 1945, this Ministry, in view of the becoming of one malarial epidemic season, has called the attention of all Commands to the necessity of acting promptly the most effective preventive measures - especially in the case of units stationed in areas of endemic malaria - in order to retard and fight the spread of the infection.

Assurances received so far from the various Regional Medical Directorates promise an early start of local soil drainage work and extermination of larvae and constitute proof of active co-operation between the Commands and Medical authorities for proper compliance with all necessary preventive measures.

During the pre-epidemic phase which may be recorded as ending on April 30th each Medical Directorate will not only provide technical training for the sounds organised at each unit for soil, drainage work and intensify all land reclamation activities, but will also prepare malarial maps of the respective areas and establish the necessary contacts with civilian medical authorities to ensure that the work of controlling malaria will be conducted with unity of purpose and in active collaboration with the authorities concerned.

In pursuance of the above mentioned circular we wish to point out that, similar to the instructions issued last year, soldier with a previous malarial history will not receive the pre-epidemic course of treatment during April unless present quinine stocks would preclude it; instead, every medical officer ~~will~~ ⁱⁿ give special attention to last year's primary cases of malaria and to chronic sufferers in order to be able to forestall any relapse in due time so as to assure, in every case, the most complete and scientific medical treatment.

Of great help in achieving this will be the census of malarial cases ordered by this Directorate and already performed almost everywhere. Bearing in mind that every case of malaria which is thoroughly cured is a centre of infection less, one should ensure that the treatment be always effective and thorough, and that it be always carefully followed up. Censuses of malarial insufficiently treated are one of the principal causes of continuous recurrence and of the ever-increasing number of gametocyte carriers; experience has shown that the more timely the diagnosis and treatment, the smaller the chances of death. Regional Medical Directorates and medical offices of Divisions and Combat Groups will issue definite instructions in this sense both to unit medical officers and to those of medical establishments and field medical units.

In order that the malarial problem may also this year find a really practical and realistic solution, it will be necessary to move the largest possible number of units from the more seriously infested areas by the first half of May at the latest - contingent upon operational and other military requirements - and to transfer them to mountain areas or, at any rate, to areas less infested by malarial mosquitoes.

...../2

Declassified E.O. 12356 Section 3.3/NND No. 785020

Sheet 2

With the aid of reports received concerning stocks on hand and requirements of various items used in the control of malaria, this Directorate will order the transfer of same supplies among the various Regional Medical Directorates so as to fill the requirements of units more directly exposed to malarial infection and make possible - in all endemic areas - a timely start of the anti-malarial campaign. Units which must remain in malarial areas because of operational requirements will adopt the following measures:-

A. Extermination of Anopheles.

1. Extermination of larvae: constitutes the best practical means of fighting malaria and will be started at once and continued until October. It will include a radius of not less than 3 Kms around the billets. It will be carried out by special squads properly organised with every unit and supervised by medical officers. Such squads will perform the following reclamation work: filling of depressions in the ground so as to eliminate even the smallest sources of malarial drainage of stagnant waters and channelling of same into running streams; management, decontamination and cleaning of all collections of water; periodic wooding and cleaning as well as emptying and cleaning every 8 - 10 days of all pools, watering troughs, etc; treating stagnant waters with petroleum products or spraying them with Paris Green. As for the former, there will be used Diesel oil or spent Diesel oil or lubricating oil thrown off by combustion engines, and it should be borne in mind that since these are high-density materials it will be necessary to dilute them with Kerosene or emulsify them with an adequate amount of water. The treatment with petroleum products will be administered after the surface of the water to be disinfected has been weeded - even if only summarily, and there will be used watering cans with thin, spraying roses and spray guns used for spraying vines with copper sulphate. There may also be used small canvas bags filled with sawdust or wood shavings soaked in Diesel Oil, Kerosene or Diesel Oil - will suffice. Give it off slowly. 30 cubic cms. of cleared of larvae. All other authorities are furnished with kerosene. The liquid to be sprayed into ponds undiluted, by means of ordinary sprays. It is used at the rate of 1 litre for each 15 square metres of water surface and the operation is repeated each week. The attention of all soldiers will be called to its toxicity in order that it may not be confused with other drugs.
2. Protection against and control of Mosquitoes: consists of mechanical prevention (individual and collective) and in the destruction of mosquitoes. As for collective prevention it will be necessary to check all openings in camp buildings and to supply inevitable shortages of wire screen with the aid of civil labourers. And when necessary, Malaria

maintenance, disinfestation and checking of all collections of water, particularly pools, watering troughs, etc; treating stagnant waters with petroleum products or spraying them with Paris Green. As for the former, there will be used Diesel oil or spent Diesel oil or lubricating oil thrown off by combustion engines, and it should be borne in mind that since these are high-density materials it will be necessary to dilute them with Kerosene or emulsify them with an adequate amount of water. The treatment with petroleum products will be administered after the surface of the water to be disinfested has been weeded - even if only summarily, and there will be used watering cans with thin, spraying roses and spray pumps used for spraying vines with copper sulphate. There may also be used small canvas bags filled with sawdust or wood shavings soaked in Diesel oil, which, when immersed in water, give it off slowly. 30 cubic cms. of Kerosene or Diesel Oil will suffice for each square metre of water surface to be cleared of larvae. All camp authorities are furnishing material, a larvicultural liquid to be sprayed into ponds undiluted, by means of ordinary sprays. It is used at the rate of 1 litre for each 15 square metres of water surface and the operation is repeated each week. The attention of all soldiers will be called to its toxicity in order that it may not be confused with other drugs.

The spraying of Paris Green will be done only by well-trained personnel under the supervision of the medical officer. There will be used a thoroughly uniform mixture to be obtained by mixing for a considerable period of time in a closed container one part of creos and 100 parts of road dust, well screened and dry. One kilo of such mixture is sufficient to destroy the larvae on a water surface of 100 square metres. The spraying will be done with a duster or even by hand. If possible, the personnel in charge will wear decontaminators' overalls, will operate windward and will take care to wash their hands when the work is completed. Containers used for this purpose will be marked "poison". If diluted as above, the Paris Green may be used also on water or troughs. It will suffice to spray Paris Green every 15 days in April and May and every 8 days during the following months. In the case of treatment with petroleum products these periods may be extended by 4 or 5 days.

2. Protection against and control of Mosquitoes: consists of mechanical prevention (individual and collective) and in the destruction of mosquitoes. As for collective prevention it will be necessary to check all openings in camp buildings and to supply inevitable shortages of wire screen with the aid of available means, individual protection will have to be limited to soldiers whose services are essential for night duty. In addition to using liquid insecticides and anti-mosquito liquid during the day, the destruction of mosquitoes may be brought about by fumigations, by burning slightly damp straw inside the billets.

B. Medical Prophylaxis.

You are notified for guidance purposes that the date on which medical prophylaxis is to start is May 1st; however definite instructions will be given in the matter. The same will be carried out as directed and with regularity, bearing in mind that enormous difficulties are encountered in obtaining supplies and that experience shows that failures are due to carelessness in carrying out instructions. There will be used soridinic preparations (mpacrine, Itcloquine, Chemicolina, etcbring cto.) at the rate of 1 tablet a day per man, to be issued with the first meal and each man will be checked off the roll as not to leave

Sheet 3

B. Medicinal Prophylaxis (cont'd)

anyone out. Men leaving malarial areas when undergoing treatment will continue to receive the same treatment at their new station for another 4 weeks.

C. Diagnosis.

All medical officers must realize the necessity of taking blood samples in each case, for further examination at the nearest medical unit. Such examination must be made with the highest degree of thoroughness, since a medical report showing an excessively high number of parasites may lead to the suspicion that a pernicious form is involved, especially in the case of individuals who never before suffered an attack of malaria. In the event that the haematoscopic examination shows a negative result and the clinical symptoms least no doubt about diagnosing the disease as malaria, the report (to be prepared in each case) should read "Indefinite form, clinical examination positive, microscopic examination negative". A like annotation will be made on the individual record of malarial cases.

D. Report.

Must contain all informative data required for a retrospective study of the symptoms diagnosed and must be prepared by the medical unit where the patient is first hospitalised.

E. Treatment of Malarial Cases.

Both in the case of men who have not yet been immunized and those who are in the course of being immunized, the initial treatment will be administered as follows:-

- for three days, 2 drams of quinine per day (in cases of pernicious malaria, the diagnosis of which must, in each case, be implemented by a haematoscopic examination, the dose may be increased up to a maximum of 3 drams per day);
- for 3 days no drugs will be administered;
- for 3 days, 2 ots of tincture or plasmochine per day or, in the absence of such products, 6 ots of curaria.

As a rule, quinine will be administered by mouth; only in cases of dangerous and proven gastric intolerance will it be administered intramuscularly. In serious and suspicious forms of perniciousness there will always be administered an injection of 1 dram of bilyhydrochloride of quinine before the patient is sent to the hospital, tincture containing that a blood sample is obtained before the injection.

Should quinine preparations be unavailable, a different procedure outlined hereunder, will be followed:-

- for 3 days, 50 cts per day of italatrine, or chemicetine or etobrine etc.,
- for 3 days no drugs will be administered
- for 3 days, 2 ots of tincture or plasmochine or 6 ots of curaria.

At the end of each of these cycles of treatment, patients will be placed in units in malarial areas will be subjected to immunisation during the remainder of the epidemic season, whereas those who at the end of the treatment do not return to malarial areas will be subjected to immunisation for one month.

Every relapse will be treated as an initial attack, and the complete cycle of treatment will be repeated.

examination negative". A like annotation will be made on the individual record of malarial cases.

D. Report.

Must contain all informative data required for a retrospective study of the symptoms displayed and must be prepared by the medical unit where the patient is first hospitalised.

E. Treatment of Malarial Cases.

Both in the case of men who have not yet been immunized and those who are in the course of being immunized, the initial treatment will be administered as follows:-

- for three days, 2 drams of quinine per day (in cases of pernicious malaria, the diagnosis of which must, in each case, be implemented by a haemocystic examination, the dose may be increased up to a maximum of 3 drams per day);
- for 5 days, 30 cts of Atthalchine or Chemiochicine or megarine etc.,
- for 3 days, 2 cts of megarine or plasmochicine per day or, in the absence of such products, 6 cts of curamine.

As a rule, quinine will be administered by mouth; only in cases of definite and proven gastric intolerance will it be administered intramuscularly. In serious and suspicious forms of perniciousness there will always be administered an injection of 1 dram of bilyhydrochloride of quinine before the patient is sent to the hospital, taking certain that a blood sample is obtained before the injection.

Should quinine preparations be unavailable, a different procedure outlined hereunder, will be followed:-

- for 3 days, 50 cts per day of itchchicine, or chemiochicine or atebrine etc.,
- for 2 days, 30 cts per day of the same products
- for 3 days, 2 cts of megarine or plasmochicine or 6 cts of curamine.

At the end of each of these cycles of treatment, patients will be given 6 units in malarial areas will be subjected to immunisation during the remainder of the epidemic season, whereas those who at the end of the treatment do not return to malarial areas will be subjected to immunisation for one month. Every release will be treated as an initial attack, and the complete cycle of treatment will be repeated.

Considerable difficulties will no doubt have to be faced under present circumstances in carrying on the fight against malaria. Heavy demands will be placed upon the initiative and zeal of all medical officers and commanders, especially to ensure the success of local soil and reclamation work and to conduct intelligent and effective propaganda among troops.

We are confident that, as in the past, the medical services will have the benefit of the wholehearted co-operation of all Commanders and officers. Please confirm that the above instructions will be carried out.
